Desde 1986 ao serviço da indústria

Fenner® power transmission products are world renowned for delivering the ultimate combination of rugged construction, reliable & efficient performance and value for money

- *proven in the harshest environments, guaranteed to perform in yours!*

All Fenner® power transmission products are manufactured to exacting specifications in line with UK and International standards, and are backed up by a product development programme designed to keep them at the cutting edge.

ENGINEERING UNITS, CONVERSIONS & FORMULAE

SI (Systeme Internationale) Basic Units – from which all other units can be derived:

Quantity	Unit	Symbol	Imperial Unit
Length	metre	m	inch
Mass	kilogram	kg	pound
Time	second	s	(same)
Electric current	Ampere	A	(same)
Temperature	Kelvin	K	Fahrenheit

Other units of measurement, and their relationship to basic SI units.

Quantity	Unit	Symbol	Relationship	Imperial Unit
Angle	radian	rad	1 rad = 1 m/m	
	degree	°	1° = 1 rad x π/180	
Area	square metre	m ²	1 m ² = 1m.m	square foot square inch
Frequency	Hertz	Hz	1 Hz = 1 s ⁻¹	cycle/sec (c/s)
Force	Newton	N	1 N = 1kg.m/sec ²	
	tonne	t	1 t = 1000 kgf	ton
	kilogramforce	kgf	1 kgf = 9.81 N	poundforce (lbf)
Pressure	Pascal	Pa	1 Pa = 1 N/m ²	
	Bar	bar	1 bar = 10 ⁵ Pa	lbf/inch ² (psi)
Energy	Joule	J	1 J = 1 N.m	
Power	Watt	W	1 W = 1 J/s	
	kilowatt	kW	1 kW = 1000W	horsepower
Elec.potential	Volt	V	1 V = 1 kg.m ² /A ² .s ³	
Elec.resist.	Ohm	Ω	1 W = 1 V/A	
Elect. capacity	Farad	F	1 F = 1 A.s/V	
Temperature	degree. Celsius	°C	1° C = 1°K	Fahrenheit
Note: the kelvin scale starts at absolute zero i.e 0°K the Celsius scale starts at 273°K i.e 0°C (freezing point of water) K and C degree intervals are the same				
Speed	metre/second	m/sec		mile per hour foot/sec
Angular	radian/second revolution/min	rad/s rev/min	1 rad/s = 1 m/m.s 1 rev/min = π/30 rad/s	
	Newton metre	Nm	1 Nm = 1 kg.m ² /sec	foot.pound pound.inch
Volume	Cubic metre	m ³	1 m ³ = 1m.m.m	cubic inch
	Litre	ℓ	1ℓ = 1m ³ /1000	Imperial Gallon
Acceleration	metre/second squared	m/sec ²	1m/sec ² = 1m/s/s 1 rad/sec ² = 1m/m.s.s	ft/sec ²
	radian/second squared	rad/sec ²		
Inertia	MR ²	kg.m ²	1kg.m ² = 1 kg.m.m	pound.inch ²
Viscosity	centiStoke	cSt	1 cSt = 1mm ² /s	

Some common units are multiples or submultiples of the above.

They use 'preferred' prefixes which indicate multiples or submultiples of basic units and make the resultant unit more relevant to the engineering business.

Prefix	Symbol	Factor
mega	M	x 1,000,000
kilo	k	x 1,000
milli	m	÷ 1,000
micro	μ	÷ 1,000,000

e.g. the Watt is a small amount of power (an average light bulb consumes 60 Watts) so the kilowatt, i.e. 1000 Watts, is more commonly used in power transmission.

Megawatts i.e. 1,000,000 Watts, are a useful unit of measure for power station capacity.

CONVERSION FACTORS

Some of the more common Imperial units are mentioned above. The following table gives a comprehensive range of metric units and factors for their conversion to appropriate Imperial units.

Length

Millimetres x 0.0394 = inches	Inches x 25.4 = millimetres
Metres x 39.37 = inches	Inches x 0.0254 = metres
Metres x 3.281 = feet	Feet x 0.305 = metres
Metres x 1.094 = yards	Yards x 0.914 = metres
Kilometres x 0.6213 = miles	Miles x 1.61 = kilometres

Force

Newtons x 0.225 = lbf	lbf x 4.45 = newtons
kgf x 2.205 = lbf	lbf x 0.454 = kgf
Metric ton x 0.984 = ton (1000kgf)	Ton x 1.02 = metric ton (2240 lbf)
kgf x 9.81 = Newtons	Newtons x 0.102 = kgf (1000kgf)

Note: kgf = kilogram force and lbf = pounds force

Area

Sq millimetres x 0.0026 = sq inches	Sq inches x 645.2 = sq millimetres
Sq metres x 10.764 = sq feet	Sq feet x 0.093 = sq metres
Sq metres x 1.196 = sq yards	Sq yards x 0.836 = sq metres

Inertia

Kilogram metre squared (kg m²) x 23.73 = Pound feet squared (lbf ft²)

Temperature

$$^{\circ}\text{C} = \frac{5}{9} (^{\circ}\text{F} - 32)$$

$$^{\circ}\text{F} = \frac{9}{5} (^{\circ}\text{C}) + 32$$

Volume

Cubic metres x 35.317 = cubic feet	Cubic feet x 0.02831 = cubic metres
Cubic metres x 1.308 = cubic yards	Cubic yards x 0.7645 = cubic metres

Fluid Volume & Pressure

Litres x 0.22 = imp. gallons	Imp. gallons x 4.546 = litres
Litres x 0.035 = cubic feet	Cubic feet x 28.32 = litres
Bar x 14.5 = pounds per sq inch (lbf/in ² or psi)	Pounds per sq inch x 0.069 = bar

Torque

Newton metre (Nm) x 0.735 =	Pounds feet (lbf ft)
Newton metre (Nm) x 8.85 =	Pounds inches (lbf in)
Kilogram force metre (kgf m) x 9.81 =	Newton metre (Nm)

Power

Kilowatt (kW) x 1.34 = horse power (hp)	Horse power (hp) x 0.746 = kilowatt (kW)
---	--

The German Pferdestärke (PS) and French Cheval-vapeur (CV) are similar to the UK/US horse power.

Pi (π)

The mathematical ratio π (pi) = 3.14159

FORMULAE

Formulae regularly used in power transmission and general engineering.

Power, Torque and Speed

These are the basic parameters of rotational power transmission, related by the following formulae

$$\text{Power (kW)} = \frac{\text{Torque (Nm)} \times \text{rotational speed (rev/min)}}{9550}$$

$$\text{Torque (Nm)} = \frac{\text{Power (kW)} \times 9550}{\text{Rotational speed (rev/min)}}$$

Torque, Inertia and Acceleration

The above power / torque formulae are used for applications at their normal running speed.

If the inertia of an application is known, the higher torque necessary to accelerate the load from rest to running speed can be calculated.

$$\text{Torque (Nm)} = \text{Inertia (kg.m}^2\text{)} \times \text{acceleration (rad/sec}^2\text{)}$$

For linear motion, a similar formula gives the force required to accelerate a mass in a straight line.

$$\text{Force (N)} = \text{Mass (kg)} \times \text{acceleration (m/sec}^2\text{)}$$

The above formulae can be applied using deceleration, to calculate braking torque or force.

Hydraulic Pumps, Motors & Cylinders

$$\text{Shaft Torque (Nm)} = \frac{\text{Displacement (cm}^3\text{/rev)} \times \text{pressure (bar)}}{20 \pi}$$

$$\text{Cylinder force (N)} = \text{Pressure (bar)} \times \text{area (m}^2\text{)} \times 10^5$$

Speed Ratio

Speed ratio is a feature of many transmission drives. Ratio is usually described by a number > 1.0, followed by “:1”. Speed reduction (usually), or increasing, must be specified.

$$\text{Ratio} = \frac{\text{Faster machine speed (rev/min)}}{\text{Slower machine speed (rev/min)}}$$

E.g. Belt drive from a 1000 rev/min motor to a blower at 500 rev/min has a 2:1 reduction ratio. Same motor driving a fan at 1500 rev/min needs a 1.5:1 increase ratio.

Gearmotor with a 6-pole (960 rev/min) motor, having a 48 rev/min output speed has a 20:1 reduction ratio.

Chain drive using two 23 tooth sprockets has a 1:1 ratio.

Centre Distance Calculation

Belt length, given pulley diameters and centre distance:

$$\text{Length (L)} = 2C + \frac{(D-d)^2}{4C} + 1.57 (D+d)$$

where

- L = Pitch length of belt in millimetres.
- C = Centre distance in millimetres.
- D = Pitch diam. of large pulley in millimetres.
- d = Pitch diam. of small pulley in millimetres.

Centre distance, given pulley diameters and belt length:

$$\text{Centre Distance (C)} = A + \sqrt{A^2 - B} \quad \text{where}$$

$$A = \frac{L}{4} - 0,3925 (D + d) \quad \text{and} \quad B = \frac{(D - d)^2}{8}$$

The above formulae can also be used for chain lengths, using sprocket pitch diameters.

Pulley/Sprocket Pitch Diameters

For pitch diameter of a synchronous belt drive pulley or chain sprocket:

$$\text{Pitch dia (mm)} = \frac{\text{Chain/belt pitch} \times \text{no. of sprocket/pulley teeth}}{\pi}$$

Indirect Drive End Loads

For vee and wedge belt drives, the following formulae give a good approximation of loads sensed by shafts and bearings.

Static tension

To determine the static tension, T_s , in the belt(s), measure the force, P , required to depress a belt 16 mm per metre of span, by means of a Belt Tension Indicator or use setting forces recommended in the belt installation instructions.

The static tension, T_s , is given by

$$T_s = 2(16P) \times B \quad (N)$$

where B = the number of belts

P = Setting force in Newtons, for the belt in question.

Centrifugal tension

The centrifugal tension, T_c , developed in a belt is a function of its weight and the square of its belt speed.

$$T_c = M \times S^2 \quad (N)$$

The belt speed, S , is given by:

$$S = \frac{(d \times n)}{19100} \quad (m/s)$$

where d = pitch diameter of either pulley - mm

n = rotational speed of same pulley - rev/min.

M = mass per unit length for the belt section in question.

See pages 35 to 37 for vee and wedge belt mass values

Dynamic tension

To determine the approximate dynamic tension, T_D , imposed by a drive when running, the centrifugal tension per span, T_c , must be subtracted from the static tension, T_s , hence:

$$T_D = 2(16P - T_c) \times B \quad (N)$$

Synchronous Belt Drives

A different rationale applies – consult your Authorised Distributor.

Chain Drives

Approximate end loads can be calculated from the torque being transmitted:

$$\text{End load (N)} = \text{Torque (Nm)}$$

$$\text{Sprocket pitch radius (m) (= } \frac{1}{2} \text{ pitch diameter)}$$

Note that this calculation can be done on either sprocket.

Low torque/small radius (high speed shaft) or high torque/large radius (low speed shaft), give the same answer.

Bearing Loads

The radial load on simple bearing arrangements due to belt/chain drive end loads, gear separating forces, the weight of pulleys or motor rotors etc. can be calculated using "moments" as shown below for two such loads applied to an arrangement of two bearings supporting a horizontal shaft.

Bearing reactions are determined by taking moments about each support.

Taking moments about bearing (2)

$$\text{Radial load on (1)} = \left(W_A \cdot \frac{(c - a)}{c} - W_B \cdot \frac{b}{c} \right)$$

Taking moments about bearing (1)

$$\text{Radial load on (2)} = \left(W_A \cdot \frac{a}{c} + W_B \cdot \frac{(b - c)}{c} \right)$$

The units of radial bearing load will be the same as for the applied loads.

In the above example both applied loads act vertically downward. Bearing reactions will also be vertical but may be upward or downward, depending on the relative values of the applied loads.

Note: The above is a simple example. Comprehensive calculations involving many other factors must be carried out to determine bearing life

Electrical Engineering and Motors

Ohm's Law gives the relationship between Voltage (V), current (A) and resistance (Ω) for "simple" electric circuits (direct current, DC or 'resistive' circuits)

$$\text{Voltage (Volts)} = \text{current (Amps)} \times \text{resistance } (\Omega)$$

Electrical power is also related to voltage and current, but as all machinery is less than 100% efficient, an efficiency, designated η must be applied to calculations

$$\text{Power (Watts)} = \text{voltage (Volts)} \times \text{current (Amps)} \times \eta \text{ (effy.)}$$

AC, or alternating current, electric motors have relatively complex electric circuits.

The above formulae apply, but need modifying by a 'power factor',

$$\text{Power Factor} = \text{cosine of the circuit phase angle, designated } \cos \sigma$$

For single phase AC electric motors:

$$\text{Power (Watts)} = \text{voltage (Volts)} \times \text{current (Amps)} \times \cos \sigma \text{ (PF)} \times \eta \text{ (effy.)}$$

In 3 phase AC electric motors, the applied voltage reaches the windings at a different value depending on whether the supply is connected in star (Y) or delta (Δ) configuration, hence 3 Φ electric motor power is usually equal to the above $\times \sqrt{3}$

AC electric motor speed is a function of supply frequency (Hz) and the number of pairs of poles, in the stator winding.

$$\text{'Synchronous' speed} = \frac{\text{supply frequency(Hz)} \times 60}{\text{pairs of poles}} \quad (\text{rev/min})$$

Most everyday electric motors are 'asynchronous', meaning they 'slip' below synchronous speed, to run at around 95-97% synchronous speed when on load.

e.g. A 6-pole (= 3 pairs), motor connected to the European standard 50 Hz supply will run at:

$$\frac{50 \text{ (Hz)} \times 60 \times 96\% \text{ (average slip)}}{3 \text{ (pairs of poles)}} = 960 \text{ rev/min}$$

Standard Motor Ratings - Three Phase

The ratings in the table below are based on Premium Efficiency (EFF1) IP55 multivoltage motors. Other manufacturers' motor performance data will be different.

Speed rev/min	Output Power		Frame Size	% of Full Load						Current (A)		Torque (Nm)			Weight kg
				Efficiency			Power Factor								
	kW	Hp		50	75	100	50	75	100	In	II / In	Cn	Tl / Tn	Tb / Tn

Efficiency, power factor and current values are based on 400V supply

- Cn = Full load torque
- II / In = Locked rotor current
- Tl / Tn = Locked rotor torque
- Tb / Tn = Breakdown torque
- In = Full load current

Both CEMEP level EFF 1 and EFF 2 motors are available from your local Authorised Distributor. (EFF 1 are on the Government technology list and approved for Enhanced Capital Allowances).

Countering the Climate Change Levy

From April 2001 the UK Government introduced a 0.45p/kWh levy on electrical energy, squeezing further the slim margins made across industry. The principle is to move the burden of taxation from efficient operations to inefficient energy users, and uses a carrot and stick approach.

The CCL at 13%, is the stick while the carrot is in the form of Enhanced Capital Allowances (ECA's) which encourage companies to invest in a specified range of energy efficient equipment. This includes inverters and motors available from your local Authorised Distributor.

The benefits are two fold. The first is reduced energy consumption and therefore cost. The second is the ability to write off 100% of the cost against profits in the first year, with the resultant tax saving.

* Dimensions for 2 pole motors.

** For frame 100L, 3kW, 4 poles, Premium Efficiency Line, the L dimension is 420 mm

+ For 90L frame size B dimension is 125mm

All dimensions in millimeters

Fenner® CHAIN DRIVES

Roller chain technology has evolved over the centuries. During this time new design features and production processes have been introduced. The new Fenner roller chain is a product of this technology.

- Extensive range of transmission roller chains and sprockets
- BS and ANSI standards
- Attachment, double pitch, conveyor, agricultural and leaf chains

Chain Drives Design Data Required

- Type of prime mover, or driving m/c
- Electric motor starting arrangement
- Rotational speed of prime mover
- Power rating of prime mover
- Type of driven machine
- Rotational speed of driven machine
- Power absorbed by driven machine
- Hours/day duty & start/stop frequency
- Both driven & driver machine shaft diameters
- Centre distance & space restraints
 - fixed centres?
 - availability of lubrication?
- Any environmental issues
 - ambient temperature
 - noise limits
 - water, oil mist etc.

Fenner® PLUS

Power Transmission Chain

It is the detailed engineering approach and years of practical experience with chain drive applications that sets Fenner power transmission products apart and can make a real difference to your drive.

Fenner PLUS chain builds on the heritage and engineering experience of the existing Fenner product range by optimising the benefits of several performance enhancing details.

Solid Rollers: Fenner PLUS solid rollers are manufactured to achieve an extremely high surface hardness ensuring high wear resistance, great performance and a long chain life.

Shot Peening: Fenner PLUS chain plates are shot peened. This process relieves stresses that build up in manufacture and extends chain life by reducing the likelihood of fatigue failure.

Progressive Punching: All Fenner PLUS chain plates are progressively punched to give excellent hole concentricity and accuracy of both diameter and pitch. This gives a quiet and accurate mesh with the sprockets, and simple pin extraction for easy chain splitting.

Case Hardened Pins: Fenner PLUS pins are specially case hardened to ensure resistance to abrasion from dust and debris and hence minimises chain 'stretch'.

Wax Lubrication: All Fenner PLUS chain is wax lubricated so that it can be run straight from the box. Debris cannot adhere to the dry wax finish, which helps protect against premature wear failure.

Easy Pin eXtraction: Strict tolerance and quality control procedures mean Fenner PLUS chain can be easily split by hand and assembled on-site.

Easy Pin eXtraction

Fenner Roller Chain Drive Selection

SELECTION

(a) Service Factor

From Table 1, determine the service factor which is applicable to the drive.

(b) Design Power

Multiply the normal running power by the service factor. This gives the Design Power which is used as the basis for selecting the drive.

(c) Chain Pitch

Refer to Table 2 (page 4) and trace to the right along the horizontal axis to the rev/min of the faster shaft. Trace upwards along the vertical axis to the Design Power. At the point of intersection, note the recommended chain pitch or pitches if there is an overlap.

(d) Speed Ratio

Divide the speed of the faster shaft by the speed of the slower shaft to obtain the speed ratio.

(e) Sprocket Sizes

Refer to Table 4 (page 6) and select driving and driven sprockets to match the Speed Ratio found in step (d). See sprocket pitch recommendations on page 4.

(f) Power Rating

Refer to the power rating tables (page 5) for the pitch of chain chosen in step (c). Read down the left hand column to the rotational speed of the faster shaft. On this line read the power rating for the simplex chain selected. These tables are for 19 tooth sprockets, if a sprocket with a different number of teeth is used, the power rating should be multiplied by the Sprocket Factor from the table at the bottom of page 5. If the power rating figure does not equal or preferably exceed the Design Power, calculated in step (b), either select a larger pitch or a multiple strand (duplex or triplex) chain. Single strand chain offers the most economical solution, and should be used where possible. However, for limitations in space, high speed or smooth running requirements a smaller pitch, duplex or triplex drive may be considered.

(g) Chain Length

To find the Chain length in pitches, use the formula below.

$$L = \frac{2C}{P} + \frac{T+t}{2} + \frac{KP}{C}$$

L = Length of chain in pitches.

C = Centre distance in mm.

P = Pitch of chain in mm.

T = Number of teeth on large sprocket.

t = Number of teeth on small sprocket.

K = Factor from Table 3 (page 6).

The calculated number of pitches should be rounded up to an even, whole number of pitches. If the centre distance cannot be adjusted, to allow for the use of an even number of pitches, it may be necessary to use an offset or cranked link, in which case the chain power rating will need to be reduced, consult your local Authorised Distributor. Re-calculate the exact centre distance required for the adjusted number of pitches. For recommended centre distance, refer to Table 5 below.

If a jockey or tensioning sprocket is used, add an extra 2 pitches.

To obtain the chain length, multiply the number of pitches by the pitch of the chain.

$$\text{Length of chain in feet} = \frac{LP}{305}$$

TABLE 1 – SERVICE FACTORS

TYPES OF DRIVEN MACHINE	TYPES OF PRIME MOVER					
	'Soft' starts			'Heavy' starts		
	Electric motors: A.C. – Star-delta start D.C. – Shunt wound Internal combustion engines with 4 or more cylinders. All prime movers fitted with centrifugal clutches, dry or fluid couplings.			Electric motors: A.C. – Direct-on-line start D.C. – Series and compound wound. Internal combustion engines with less than 4 cylinders.		
Hours per day duty						
	10 and under	Over 10 to 16	Over 16	10 and under	Over 10 to 16	Over 16
Light Duty Agitators (uniform density), Belt conveyors (uniformly loaded).	1.0	1.1	1.2	1.1	1.2	1.3
Medium Duty Agitators and mixers (variable density). Belt conveyors (not uniformly loaded), Kilns, Laundry machinery, Lineshafts, Machine tools, Printing machinery, Sawmill and woodworking machinery, Screens (rotary).	1.1	1.2	1.3	1.2	1.3	1.4
Heavy Duty Brick machinery, Bucket elevators, Conveyors (heavy duty), Hoists, Quarry plant, Rubber machinery, Screens (vibrating), Textile machinery.	1.3	1.4	1.5	1.5	1.6	1.7

EXAMPLE

Select a chain drive to transmit 1.5 kW from a gearbox running at 80 rev/min and driven by a direct-on-line electric motor, to a uniformly loaded conveyor drive shaft which is required to run at approximately 40 rev/min for 12 hours per day. Gearbox output shaft is 35mm and the conveyor headshaft is 65mm diameter.

(a) Service Factor

From Table 1 the Service Factor is 1.2.

(b) Design Power

= 1.5 x 1.2 = 1.8 kW.

(c) Chain Pitch

By referring to Table 2 (page 4), the intersection of design power and the rev/min of the faster shaft indicates a 16B 1" pitch chain.

(d) Speed Ratio

$$\frac{80}{40} = 2:1$$

(e) Sprocket Size

From Table 4 (page 6) sprockets of 19 and 38 teeth give a ratio of 2 : 1.

(f) Power Rating

The power ratings for 16B chain are given on page 5. The required power rating from step (b) is 1.8 kW. For a 19T driver sprocket, running at 80 rev/minute, the power rating for 16B-1 simplex chain is 3.79 kW. As this exceeds the required

design power the selection is satisfactory.

If space limitations demand smaller sprocket dimensions, alternative selections would be: use 12B-2 duplex chain which has a power rating of 2.11 kW at 80 rev/min or 15T driving to 30T on 16 B-1 1" simplex chain - power rating 0.8 x 3.79 = 3.03 kW

g) Chain Length

Recommended centre distance for 16B-1 chain is 1000 mm (Table 5 below).

Therefore the chain length as per selection step (g) (chain length) is 108 pitches including a connecting link.

Drive Specification

108 pitches or 9 feet of Fenner 16B-1 chain 81-19 Driver Sprocket with a 2517 x 35mm bore 81-38 Driven Sprocket with a 3020 x 65mm bore

Alternative selection

Recommended centre distance for 12B-2 chain is 900 mm (Table 5 below).

Therefore the chain length as per selection step (g) (chain length) is 124 pitches including a connecting link.

Alternative Drive Specification

124 pitches or 7.75 feet of Fenner 12B-2 chain 62-19 Driver Sprocket with a 2012 x 35mm bore 62-38 Driven Sprocket with a 3020 x 65mm bore.

TABLE 5 - RECOMMENDED CENTRE DISTANCE

Chain Pitch	Inches	3/8"	1/2"	5/8"	3/4"	1"	1.1/4"	1.1/2"	1.3/4"	2"
	mm	9.525	12.7	15.875	19.05	25.4	31.75	38.1	44.45	50.8
Centre Distance	mm	450	600	750	900	1000	1200	1350	1500	1700

TABLE 2 - BRITISH STANDARD CHAIN

GENERAL RECOMMENDATIONS ON SPROCKET SIZES

19 teeth and above —

Sprockets running at medium to maximum speeds on normal applications (see power ratings for speeds on page 5).

17 teeth —

Permissible to use this sprocket on very small pitches ie, 8mm and 3/8". Refer to section above, but should be restricted to slow speed drives (see power ratings for speeds on page 5).

15 teeth or less —

Should be avoided unless shaft speed is below 100 revs/min.

23 teeth and above —

Recommended for impulse applications.

When ratios are low, the use of sprockets with high numbers of teeth minimises joint articulation, chain pull and bearing loads. If a small number of teeth are used on high speed, high load applications, hardening of teeth should be considered. Ratios over 7:1 are not recommended for single strand drives. In all drives where ratios exceed 5:1 the designer should consider using compound drives for maximum service life.

On drives where ratios exceed 3:1 the shaft centre distance should not be less than the sum of the sprocket pitch circle diameters.

For drives with vertical shafting always use multi-strand chains.

For weight in metres multiply by 3.281

Straight side plates.

Chain is sold in units of feet

All Fenner Standard and Fenner PLUS chains are equivalent to or exceed ISO 606 minimum tensile strength

or metres, depending on

The above dimensions are for Fenner PLUS chain, some non-functional dimensions may differ slightly for Fenner Standard Chain

geographical market

AMERICAN STANDARD ROLLER CHAINS
ANSI B29.1, ISO R606, DIN 8188

ANSI standard chain is dimensionally similar to BS chain but with generally thicker plates resulting in a narrower b1 dimension between inner plates. The pitching between strands of duplex and triplex chain, dimension Pt may also vary from BS chain.

Care should be taken to ensure that correct sprockets are used with ANSI chain.

AMERICAN STANDARD ROLLER CHAINS

"H" SERIES ROLLER CHAINS

ANSI "H" Series chains are dimensionally identical to ANSI standard chains except that the sideplates are thicker. The heavier side plates provide some additional fatigue resistance. They are primarily intended for applications where occasional shock loads are likely to cause fatigue failures in the chain. Whilst there is an increase in tensile strength, the wear life of the case hardened pins remains the same as for standard chain.

Simplex "H" series chains operate on standard ANSI sprockets. Multiple strand "H" chain require non-standard ANSI sprockets because of the thicker side plates.

Note; Refer to your local Authorised Distributor for dimensional details of ANSI "H" Series multiple strand chain

"SH" SERIES ROLLER CHAINS

ANSI "SH" series chains are identical to "H" series but they have a different pin material, which is through hardened. The surface hardness is less than that of the carburised pins in the ANSI standard and ANSI "H" series chains but through hardened pins provide additional fatigue resistance, at some slight sacrifice in wear life.

Simplex "SH" series chains operate on standard ANSI sprockets. Multiple strand "SH" series chain requires non-standard ANSI sprockets because of the thicker side plates.

STAINLESS STEEL CHAINS

Material: AISI 304 Stainless Steel for optimum corrosion resistance, having regard for tensile strength and wear life considerations. Stainless steel chain is not as hard or as strong as carbon steel chain. AISI 304 Stainless Steel may have some slight residual magnetism due to cold working of the pins, bushes and rollers in manufacture. For applications where non-magnetic chain is required consult your local Authorised Distributor.

CHAINS WITH EXTENDED PINS

The following extended pins, for British and ANSI chains, conform generally with the ISO "Standard". Other manufacturers standards may differ in detail.

The critical dimensions are extended length and diameter and requirements should be checked against the dimensions below.

Duplex and triplex pin lengths can be supplied to order.

ISO Chain No	ANSI Chain No	Pitch	Width Between Inner Plates	Pin Diameter	Extended Length	Pin Length	
		P mm	b1 mm	d2 mm	L3 mm	L max mm	Lc max mm
08B		12.700	7.75	4.45	9.50	25.10	26.60
10B		15.875	9.65	5.08	11.90	30.10	31.50
12B		19.050	11.68	5.72	14.30	35.40	37.10
16B		25.400	17.02	8.28	19.10	53.00	54.30

Chain is sold in units of feet or metres, depending on geographical market

'S' TYPE STEEL AGRICULTURAL CHAINS

All 'S' type chain and attachments can be supplied zinc plated.
Please specify at time of order.

Fenner® PLUS

High Performance Sprockets
Hardened teeth for a longer life.

Fenner PLUS sprockets have been re-engineered to become the perfect partner for the new Fenner PLUS roller chain.

All Fenner PLUS sprockets up to circa 40 teeth are manufactured from C45 grade steel - a 0.45% plain carbon steel ideally suited to through hardening.

Hardened Teeth:

Fenner PLUS steel sprockets up to circa 40 teeth have hardened teeth - hardened to just below the tooth root.

Increased Life:

The superior hardened sprocket dramatically improves both chain and sprocket life by up to 50%.

Reduced Noise:

The teeth on Fenner PLUS sprockets are carefully hardened to specified levels, allowing accurate mesh to be maintained longer and therefore reducing drive noise.

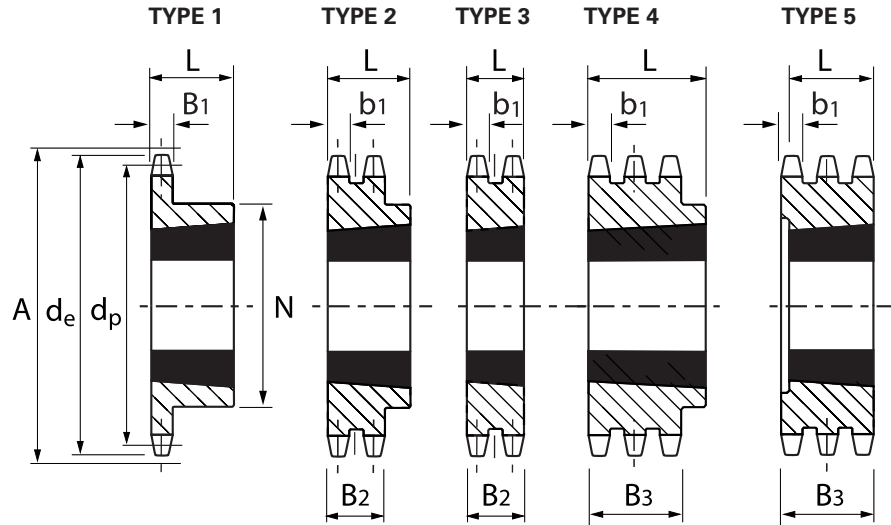

Use with Fenner PLUS high performance chain for exceptional performance and value.

MATERIAL: Steel grade C45

To complete the product code insert the number of teeth required (027C0009 = 20B-1 1.1/4" pitch 9 tooth simplex platewheel)

NOTE: Platewheels for use with friction torque limiting devices may require a special surface finish.

INSTALLATION NOTES

Shafts must be parallel. Supporting structures must be of sufficient rigidity to maintain true alignment.

Mount sprockets as close as possible to bearings.

Check correct alignment of each sprocket by use of a straight edge.

Roller chain can be used in practically any position provided the shafts are parallel.

Where the slack strand is nearly vertical, or where torque variation causes waves or whip in the chain, an idler must be used to take up the excessive slack. The idler should preferably be near to the larger sprocket in the drive, located on the outside of the slack strand of the chain. Where layout makes this impossible it is permissible to locate the idler on the inside of the chain.

CHAIN TENSION

Chains should be fairly tight at installation with only a small amount of slack.

With vertical drives the chain should be kept snug. After the first few weeks of operation, re-check chain tension and adjust if necessary.

FIXED CENTRE APPLICATIONS

An idler sprocket is generally recommended for fixed centre drives. It should be positioned on the slack side as close to the larger sprocket as feasible. The tensioning sprocket should have a minimum of three teeth engaged and be a minimum of four links away from the nearest sprocket.

CHAIN TENSIONERS

LUBRICATION

Effective lubrication is essential in order to ensure optimum wear life from any chain.

To be effective it must form a film of lubricant between the wearing parts, (the pin and bush), of the chain. It has therefore to be of suitable viscosity and be delivered to the gap between the sideplates such that it can penetrate into the space between the pin and bush. The viscosity, amount and type of lubricant is governed by the size of chain and the operating conditions involved. Oil will only penetrate into the bearing area of the chain when the chain is slack, therefore oil should be delivered to the slack strand just after the driver sprocket.

High speed drives are especially critical. These generally require a continuous stream of lubricant applied across the full chain width in order to act as a coolant as well as lubricating the bearing area.

Three basic lubrication methods are recommended for use with Fenner roller chain.

TYPE 1 Drip Feed (for linear chain speeds up to 1 m/sec.)

Oil drops directed between the side plate gaps with a drip feed lubricator. Brush applicators may also be used, provided they are positioned to ensure that the oil is correctly delivered to the gap between the side plates. Volume and frequency should be sufficient to prevent discolouration of the lubricant in the chain joints. Any discolouration of the lubricant or of the

pin will indicate insufficient lubrication penetrating into the bearing area. Air movement, due to the motion of the drive, can disturb and mis-direct the oil drops, therefore, with due regard for safety, check the applicator while the drive is running.

TYPE 2 Oil Bath or Disc Lubricator (for linear chain speeds up to 6 m/sec.)

With oil bath lubrication the lower strand of chain runs through an oil sump. With the chain running, the oil level in the sump should immerse the chain at its lowest point. The oil level and condition of the oil should be checked periodically to ensure sufficient volume of oil is present and that it has not emulsified or become contaminated.

A disc or oil slinger may also be used. In which case the disc picks up oil from the sump and deposits it on the chain, usually through a trough. The chain operates above the oil level. The diameter of the disc should be sufficient to ensure a rim speed between 3 and 15 m/s.

TYPE 3 Pump and Sump (for high speed drives).

Oil is pumped from the sump by a circulating pump capable of delivering a constant stream of oil, evenly distributed across the full width of the chain. The oil should be supplied on the inside of the chain loop and at the lower strand, when chain speeds exceed 10 m/s.

CHAIN LUBRICATION

Taper Lock® Installation Instructions

TAPER LOCK® BUSH INSTALLATION

TO INSTALL

1. After ensuring that the mating tapered surfaces, bore and shaft, are completely clean and free from oil or dirt, insert the bush into the hub so that holes line up.
2. Slightly oil thread and point of grub screws, or thread and under head of cap screws. Place screws loosely in holes threaded in hub, shown thus ⊙ in diagram.
3. If a key is to be fitted, place it in the shaft keyway before fitting the bush. It is essential that it is a parallel key and side fitting only and has TOP CLEARANCE.
4. Clean shaft and fit hub to shaft as one unit and locate in position desired, remembering that bush will nip the shaft first and then hub will be slightly drawn on to the bush.
5. Using a hexagon wrench tighten screws gradually and alternately to torque shown in table below.
6. Hammer against large-end of bush, using a block or sleeve to prevent damage. (This will ensure that the bush is seated squarely in the bore.) Screws will now turn a little more. Repeat this alternate hammering and screw tightening once or twice to achieve maximum grip on the shaft.
7. After drive has been running under load for a short time stop and check tightness of screws.
8. Fill empty holes with grease to exclude dirt.

INSERT BUSH

INSERT SCREWS AND LOCATE ON SHAFT

TIGHTEN SCREWS FINGER TIGHT

TIGHTEN SCREWS ALTERNATELY

REMOVING A TAPER LOCK BUSH

TO REMOVE

1. Slacken all screws by several turns, remove one or two according to number of removal holes shown thus ● in diagram. Insert screws into removal holes after oiling thread and under head of cap screws.
2. Tighten screws alternately until bush is loosened in hub and assembly is free on the shaft.
3. Remove assembly from shaft.

SHEARGUARD CLUTCH

The Shearguard clutch uses wedge pins for torque control, to give a simple, accurate and reliable drive overload protection. An added advantage is that the wedge pins are bolted in position and cannot fall into machinery when sheared by overload. The clutch is designed to accommodate standard platewheels for fast delivery chain drive protection.

TORQUE LIMITER

The Torque Limiter utilises spring loaded friction surfaces to limit the torque transmitted in a drive system. Protection against shock loads is achieved by a pre-set force.

When torque demand exceeds this pre-set value the unit slips, automatically re-engaging when overload torque has passed with no re-setting required.

The four sizes of Torque limiters available are designed to use a range of specially surface ground platewheels.

We recommend and offer from stock specially ground platewheels for use with all Torque Limiters.

CHAIN LUBRICANTS

Recommended lubricant is a penetrating non-mineral oil which lubricates the chain pins and frees seized chain. It forms a dry film which will not attract dust and dirt, and is also non-drip.

High temperature lubricant is also available.

Improved Performance, Longer Life.

The new Fenner Drive Alignment Laser is the perfect tool for pulley and sprocket alignment. Applied magnetically in just a few seconds, the laser line projects onto targets, allowing rapid adjustment to perfect alignment. It could not be simpler!

- Reduces wear on belts and pulleys
- Increases drive efficiency for larger energy savings
- Quick and easy to use, producing more accurate results than other methods
- Shows parallel and angular misalignment
- Suitable for both vertical & horizontal mounted machines

Fenner® FRICION BELT DRIVES

Fenner friction belt drives have set the pace for over a century and will continue to do so with the recent addition to the range of Fenner Quattro PLUS high power cogged raw edge belts.

- State of the art design and manufacture reflected in optimised power ratings, for compact size, economy, efficiency and extended life
- PB (Precision built) construction allows 'one-shot tensioning' for fit & forget applications
- Fullest range of international standard belt lengths and pulleys available
- All belts have superior anti-static, heat and oil resistant properties

**Friction Belt Drives
Design Data Required**

- Type of prime mover, or driving m/c
- Electric motor starting arrangement
- Rotational speed of prime mover
- Power rating of prime mover
- Type of driven machine
- Rotational speed of driven machine
- Power absorbed by driven machine
- Hours/day duty & start/stop frequency
- Both driven & driver machine shaft diameters
- Centre distance & space restraints
 - fixed centres?
 - adjustment?
- Space restraints
- Any environmental issues
 - ambient temperature
 - water, oil mist, solvents etc.

Ultra Plus 140

Fenner®

THE LANGUAGE OF POWER TRANSMISSIONS

The Ultimate heavy duty drive belt for harsh environments.

**High Modulus
Aramid Cords**

140% Power Transmission!

The Ultra Plus 140 uses high modulus Aramid cords to transmit up to 40% more power than standard wedge belts.

**Chloroprene
Rubber Core**

Inner Strength!

The aramid cords are supported by a chloroprene rubber core and protected by a double layer jacket, to give rugged durability and low maintenance requirements.

**Double Layer
Outer Jacket**

96% Energy Efficiency!

The double layer outer jacket of the Ultra Plus 140 is a unique construction to improve flexibility for efficiency while providing incredible protection of the Aramid core.

State-of-the-art, high efficiency drive belt engineering.

Fenner Classic PB V-Belts

ISO 4184 - DIN 2215 - BS 3790 - RMA IP20

Fenner Classic **PB** V-Belts have specially treated jackets to give superior anti-static, heat and oil-resistant properties.

All Fenner Classic V-Belts are static conductive to **ISO 1813** and conform to the anti-static specifications of the American Petroleum Institute (API).

Section dimensions in millimetres.
Metric designations show pitch length in millimetres.
Imperial designations show inside length in inches.

MASS PER UNIT LENGTH kg/m		Metric belt designation denotes pitch length in mm
BELT SECTION	STD BELT	
Z	0.055	Z: Li = Lp - 26 mm
A	0.094	A: Li = Lp - 34 mm
B	0.163	B: Li = Lp - 45 mm
C	0.284	C: Li = Lp - 58 mm
D	0.560	D: Li = Lp - 85 mm
		Li: = inside length
		Lp: = pitch length

* These lengths may not be available from stock. Consult your local Authorised Distributor for non-listed belt lengths.

PRODUCT CODES

8 digit for standard V-belts.

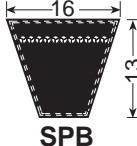

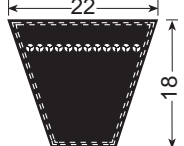

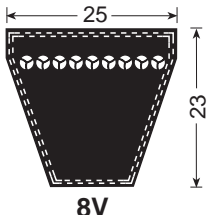

Digits 1 to 3: constant 240.
Digit 4: section letter Z, A, B, C or D.
Digits 5 to 8: 0 then first 3 of 4-figure metric lengths or, first 4 of 5-figure metric lengths.
E.g.: C10700 is coded 240C1070.

WORKING TEMPERATURES

Fenner V-belts perform satisfactorily within the ambient temperature range -40 to 70°C.

ISO 4184 – DIN 7753 – BS 3790 – RMA IP22

In addition to their precision-built qualities, Fenner Power Plus **FB** wedge belts have superior anti-static and oil-resistant properties. All Fenner Power PLUS wedge belts are static conductive to the **ISO 1813** standard and conform to the anti-static specifications of the American Petroleum Institute (API) for similar belts. They will not readily self-ignite under severe slip/stall conditions, subject to maximum surface temperature limitations.

				1732	-	7500	2800		
						8000	3150		

Section dimensions in millimetres. Italic type denotes not held in stock at all locations. Bold type denotes standard sizes in ISO 4184.

Metric designations show pitch length in mm. Imperial designations show 'effective' length in 1/10 inches

Note: The ISO 4184 standard now refers to 'datum' lengths, which are essentially the same as 'pitch' lengths.

Fenner CRE PLUS® & Quattro PLUS® CRE Wedge Belts

Section 2

ISO 4184 – DIN 7753 – BS 3790

Fenner cogged raw edge wedge belts are precision built **FA** for excellent length matching. They are manufactured from high quality polymer and textile materials for superior heat and oil resistance. All Fenner CRE PLUS and Quattro PLUS cogged raw edge wedge belts are static conductive to the **ISO 1813** standard and conform to the anti-static specifications of the American Petroleum Institute (API) for similar belts. They will not ignite under severe slip/stall conditions, subject to maximum surface temperature limitations.

CRE PLUS
Quattro PLUS

DATA FOR ALL WEDGE BELTS

Metric belt designation denotes pitch length in mm.			
SPZ:	Lo = Lp + 13mm		
SPA:	Lo = Lp + 18mm		
SPB:	Lo = Lp + 22mm		
SPC:	Lo = Lp + 30mm		
	Lp = Pitch length		
	Lo = Outside length		
PITCH LENGTH Lp = Li + mm (Inside length)			
BELT SECTION	WRAPPED BELT	CRE BELT	QUATTRO PLUS
SPZ	37	38	30
SPA	45	44	40
SPB	60	58	60
SPC	90	-	80
8V	120	-	-
MASS PER UNIT LENGTH kg/m

SPC	0.32	—	0.36
8V	0.54	—	—

PRODUCT CODES

8 digit for standard wedge belt.
 Digits 1 to 3:
 Product Group 260 Power Plus
 267 CRE Plus
 269 Quattro Plus
 Digit 4:
 Section Letter (SP, XP, QXP) Z, A, B, C
 D (8V).
 Digits 5 to 8:
 Length 0 then first 3 of 4-figure lengths or, first 4 of 5-figure lengths.
 E.g.: Power Plus SPB 2800 is coded 260B0280.
 Quattro plus QXPZ 1250 is coded 269Z0125

WORKING TEMPERATURES

Fenner Power Plus and CRE Plus wedge belts perform satisfactorily within the temperature range -40 to 70°C.
 Quattro Plus temperature range -40 to 80°C

Metric designations are 'pitch' lengths in mm. Imperial belt designation denotes approximate 'effective' length in tenths of an inch in accordance with RMA standards.

Note: The ISO 4184 standard now refers to 'datum' lengths, which are essentially the same as 'pitch' lengths.

For similar cross sections, other designations include
 SPZ, Alpha, 3V & 9N
 SPB, Beta, 5V & 15N
 8V, Delta, & 25N

SPZ, SPA, SPB & SPC belt designations shown in heavier type identify standard sizes in ISO 4184.

Belt lengths in italic type are available but not ex stock in all locations.

Consult your local Authorised Distributor for non-listed belt lengths.

FRICION BELT DRIVES

(a) Speed Ratio

Calculate Speed Ratio by dividing the rev/min of the faster shaft by the rev/min of the slower shaft.

(b) Service Factor

From Table 3 (page 39), select the Service Factor which is applicable to the drive. If the drive is speed increasing, an additional factor may be required – refer to top of Table 3.

(c) Design Power

Multiply the normal running power or prime mover power by the Service Factor. This gives the Design Power which is used as the basis for selecting the drive.

(d) Belt Section & Type

Refer to Table 2 (opposite) and trace to the right along the horizontal axis to the rev/min of the faster shaft. Trace upwards along the vertical axis to the Design Power. Choose the belt section and type represented by the area in which the point of intersection falls.

(e) Minimum Pulley Diameter

Refer to Table 1 (below) and select the minimum recommended pulley, using the Design Power from step (c) and the faster shaft speed. This is a guide to the minimum pulley pitch diameter capable of transmitting the design power at the given speed, without generating excessive bearing loads.

(f) Pulley Pitch Diameters

Refer to the drive selection tables on pages 40 to 51 and for the belt section chosen read down the speed ratio column to the value nearest the calculated speed ratio. Use the Minimum Pulley Diameter from step (e) as a guide to the small pulley selection.

(g) Belt Length, Centre Distance and Correction Factor

The drive tables list ISO belt lengths.

Along the same line as the chosen Speed Ratio read across the table to find a suitable Centre Distance. The required Belt Length is given at the head of the column.

Note the Correction Factor by following the colour band in which the chosen centre distance falls, to the top of the table.

If the Centre Distance is not specified consider a drive with a centre distance approximately equal to the sum of the pulley pitch diameters.

When non-standard pulleys or belts are used the Centre Distance and Belt Length can be calculated using the formulae given on page iii of the technical information section. Interpolate from the tables for the Correction Factor.

(h) Basic Power per Belt

Refer to the power rating tables (pages 52 to 59) for the section and type of wedge belt chosen. In the left-hand column locate rev/min of the faster shaft, i.e. the one with the small pulley. Read across to the column headed by the pitch diameter of the small pulley and note the rated power.

For CRE Plus belts refer to page 54 for power ratings.

Note that Fenner pulleys are designed for belt speeds up to 40 m/s. If using non-Fenner pulleys seek manufacturer's approval at high speeds.

N.B. The powers listed in the columns headed by the motor speeds in the Drive Tables (pages 40 to 51) give the power per belt including Speed Ratio Increment, step (j), for Power Plus wedge belts.

These powers require correcting for belt length and arc of contact correction factor (g) and should be used in conjunction with the appropriate Service Factor.

(j) Speed Ratio Power Increment

From the power rating tables (pages 52 to 59) note the additional power per belt for the Speed Ratio being used.

This value is the same for all types of belt of a given section.

(k) Corrected Power per Belt

Add the Speed Ratio Power increment (j) to the Basic Power per Belt (h) and multiply by the Correction Factor from step (g).

(l) Number of Belts required

Divide the Design Power from step (c) by the Corrected Power per Belt (k). The result gives the number of belts required. If the answer contains a fraction use the next whole number.

(m) Bore sizes

Check that the pulleys will fit shafts by referring to the pulley dimension tables (pages 60 to 67).

* This table is intended as a guide to selection only. Bearing loads should be carefully considered when using small pulleys on electric motors. This is particularly important when using the small pulleys allowable with CRE Plus or Quattro Plus belts.

Wedge Belt Drives Selection

EXAMPLE

Design a wedge belt drive from a 50 kW 6 cylinder diesel engine which runs at 1050 rev/min to a reciprocating compressor running at 660 rev/min. The centre distance is to be approximately 1600 mm and the duty is 24 hours/day. The engine shaft is 70 mm diameter and the compressor shaft 80 mm diameter.

(a) Speed Ratio

$$\text{Speed ratio} = \frac{1050}{660} = 1.59:1$$

(b) Service Factor

From Table 3 the service factor is 1.4.

(c) Design Power

$$= 50 \times 1.4 = 70 \text{ kW}$$

(d) Belt Section

By referring to Table 2 (opposite) the intersection of design power and the speed of the faster shaft indicates SPB or QXPB section.

(e) Minimum Pulley

From Table 1 (page 38) the minimum recommended pulley is approximately 250 mm.

(f) Pulley Pitch Diameters

By referring to the centre distance tables relating to SPB section belts on page 47 the selection is a driving pulley of 315 mm pitch diameter and a driven pulley of 500 mm pitch diameter.

(g) Belt Length, Centre Distance and Correction Factor

Reading across the table, the nearest centre distance to the 1600 mm required is 1607 mm. The belt length at the head of the column is 4500. By following the colour shading to the top of the table, a correction factor of 1.05 is noted.

(h) Basic Power per Belt

From the power rating table (pages 52 & 59) by interpolation the rated power/belt for a 315 mm pitch diameter pulley at 1050 rev/min is 18.67 kW for Power Plus SPB (22.37 for Quattro Plus QXPB)

(j) Speed Ratio Power Increment

The power increment (by interpolation) for a speed ratio of 1.59 at 1050 rev/min is 0.77 kW. (pages 56)

(k) Corrected Power per Belt

$$= (18.67 + 0.77) \times 1.05$$

$$= 20.41 \text{ kW per belt. (24.3 for QXPB)}$$

(l) Number of Belts required

$$= \frac{70}{20.41} = 3.43 \text{ i.e use 4 SPB Power Plus wedge belts.}$$

or

$$= \frac{70}{24.3} = 2.88 \text{ i.e use 3 QXPB Quattro Plus belts.}$$

(m) Bore Sizes

From pulley dimension tables, a 315mm x 4 SPB has a bush size 3525 with 100 mm max. bore (315 mm x 3 SPB has a bush size 3020 with 75 mm max. bore).

Either will fit the 70 mm dia. engine shaft.

500 mm x 3 or 4 SPB pulleys, both of which have a bush size 3525, will fit the 80 mm dia. compressor shaft.

DRIVE SPECIFICATION

	Power Plus SPB	Quattro Plus QXPB
Engine pulley	315 x 4SPB	315 x 3 SPB
Taper Lock bush	3525/70 mm	3020/70mm
Compressor pulley	500 x 4SPB	500 x 3SPB
Taper Lock bush	3525/80 mm	3525/80mm

4 x SPB 4500 wedge belts give 1607 mm centres.

3 x QXPB 4500 wedge belts give 1607 mm centres.

TABLE 3: SERVICE FACTORS

SPEED INCREASE RATIO		TYPES OF PRIME MOVER					
		'Soft' starts			'Heavy' starts		
For speed increasing drives of: Speed ratio 1.00 – 1.24 multiply service factor by 1.00 Speed ratio 1.25 – 1.74 multiply service factor by 1.05 Speed ratio 1.75 – 2.49 multiply service factor by 1.11 Speed ratio 2.50 – 3.49 multiply service factor by 1.18 Speed ratio 3.50 and over multiply service factor by 1.25		Electric motors: AC – Star Delta start DC – Shunt wound Internal combustion engines with 4 or more cylinders Prime movers fitted with centrifugal clutches, dry or fluid couplings or electronic soft start devices			Electric motors: AC – Direct-on-line start DC – Series & compound wound Internal combustion engines with less than 4 cylinders Prime movers not fitted with soft start devices

Pitch diameters in italic type indicates drives where the use of CRE Plus or Quattro Plus belts are recommended. The above drives are based on the ISO belt length designations, other belt lengths and pulley combinations are available - consult your local Authorized Distributor. All dimensions in millimetres.

Fenner® Quattro PLUS

Premium CRE Belt

State-of-the-art, high efficiency drive belt engineering.

- Transmits four times the power of original V belts
- Allows a more compact drive envelope
- Precision built, eliminating the need for matching
- Superior anti-static, heat and oil resistance
- Ideal problem solving belt
- High efficiency for low running costs

www.fptgroup.com

Centre Distance SPA, XPA, QXPA Wedge Belt Drives

Table with columns for Combined Arc and Belt Length Correction Factor, Speed Ratio, Pitch Diameter of Pulleys, Power per SPA Belt (kW), BELT LENGTH, SPA, QXPA ONLY, SPA ONLY, and Speed Ratio. Rows list various belt sizes and power ratings across different speed ratios.

Pitch diameters in italic type indicates drives where the use of CRE Plus or Quattro Plus belts are recommended. The above drives are based on the ISO belt length designations, other belt lengths and pulley combinations are available - consult your local Authorised Distributor. All dimensions in millimetres.

Centre Distance SPB, XPB, QXPB Wedge Belt Drives

Table with columns for Speed Ratio, Pitch Diameter of Pulleys, Power per SPB Belt (kW), BELT LENGTH, and Speed Ratio. Rows list various belt sizes (112, 118, 125, 132, 140, 150, 160, 170, 180, 190, 200, 212, 224, 236, 250, 280, 315) and their corresponding dimensions and power ratings for different belt types (0.85, 0.90, 0.95, 1.00, 1.05, 1.10, 1.15).

Pitch diameters in italic type indicates drives where the use of CRE Plus or Quattro Plus belts are recommended. The above drives are based on the ISO belt length designations, other belt lengths and pulley combinations are available - consult your local Authorised Distributor. All dimensions in millimetres.

The above drives are based on the ISO belt length designations, other belt lengths and pulley combinations are available - consult your local Authorised Distributor.

Fenner® Efficiency Drive

Get the most from your wedge belt drives

Wedge belt drives can offer as much as 96% efficiency in power transmission on most applications.

To achieve and maintain such efficiency, requires optimum drive design, care on installation, and simple regular maintenance. The Fenner Wedge Belt Drive Maintenance Kit can help achieve this.

The kit contains the simple tools necessary to help achieve optimum performance.

- Guide to efficient wedge belt operation - including belt efficiency audit questionnaire.
- Fenner belt tension indicator - simple tool to ensure accurate belt tension.
- Pulley groove gauge - check pulley wear

For laser pulley alignment (rather than simply 'string') see the Fenner Drive Alignment Laser page 32

Order yours today: Product Code: 230K0000

Centre Distance SPC, XPC, QXPC Wedge Belt Drives

Table with columns for Speed Ratio, Pitch Diameter of Pulleys (Driver/Driven), Power per SPC Belt (kW), BELT LENGTH (2000-6000), SPC ONLY (6300-12500), and Speed Ratio. Rows list combinations of speed ratios and pulley sizes (e.g., 1.00 with 224/224 pulleys).

The above drives are based on the ISO belt length designations, other belt lengths and pulley combinations are available - consult your local Authorised Distributor. All dimensions in millimetres. Drive combinations are available using 200mm & 212mm pitch diameter pulleys and Quattro Plus belts - consult your local Authorised Distributor.

Power Ratings - SPZ & SPB Wedge Belts

POWER RATINGS - SPZ WEDGE BELTS

Table with columns: Rev/min of faster shaft, RATED POWER (kW) PER BELT FOR SMALL PULLEY PITCH DIA (mm) [63, 67, 71, 75, 80, 85, 90, 95, 100, 112, 125, 140], and Belt Speed (m/s) [10, 20, 30, 40]. Rows list power ratings for various speeds from 100 to 6000 rev/min.

POWER RATINGS - SPB WEDGE BELTS

Table with columns: Rev/min of faster shaft, RATED POWER (kW) PER BELT FOR SMALL PULLEY PITCH DIA (mm) [140, 150, 160, 170, 180, 190, 200, 212, 224, 236, 250, 280, 315], and Belt Speed (m/s) [10, 20, 30, 40]. Rows list power ratings for various speeds from 100 to 3000 rev/min.

Additional Power Ratings for Speed Ratio

Type 6NR pulleys are made to catalogue dimensions, but modern manufacturing techniques result in there being no recess behind the Taper Lock bush, the J dimension is then approximately equal to the small diameter of the Taper Lock bush.
 Dimensions in millimetres unless otherwise stated. *Non-preferred pulley sizes. Pitch diameters in italic type indicate pulleys to be used with ZV-belts, XPZ & QXPZ wedge belts only.
 All envelope, prime functional and Taper Lock bush dimensions are correct at the time of publication. Non-functional dimensions may vary slightly.
 These pulleys are designed to operate at rim speeds upto 40m/sec, for higher speeds contact your local authorised distributor.

Taper Lock® Pulleys for Z, SPZ, XPZ & QXPZ Belts

Dimensions in millimetres unless otherwise stated.

* Non-preferred pulley sizes.

Intermediate diameters available on a non-stock basis, see page 68

All envelope, prime functional and Taper Lock bush dimensions are correct at the time of publication. Non-functional dimensions may vary slightly. These pulleys are designed to operate at rim speeds up to 40m/sec, for higher speeds contact your local authorised distributor.

Dimensions in millimetres unless otherwise stated.

* Non-preferred pulley sizes.

Intermediate diameters available on a non-stock basis, see page 68

All envelope, prime functional and Taper Lock bush dimensions are correct at the time of publication. Non-functional dimensions may vary slightly. These pulleys are designed to operate at rim speeds upto 40m/sec, for higher speeds contact your local authorised distributor.

Dimensions in millimetres unless otherwise stated.

* Non-preferred pulley sizes.

All envelope, prime functional and Taper Lock bush dimensions are correct at the time of publication.

Non-functional dimensions may vary slightly.

These pulleys are designed to operate at rim speeds upto 40m/sec, for higher speeds contact your local authorised distributor.

Pitch diameters in italic type indicate pulleys to be used with C V belts, XPC & QXPC wedge belts only.

Taper Lock® Pulleys for C, SPC, XPC & QXPC Belts

These additional sizes of Taper Lock® vee pulleys are readily available but are not stocked at all distribution outlets.

Sizes in bold type use long series Taper Lock® bushes.

10 groove SPB pulleys with long series Taper Lock® bushes are also available in diameters from 200mm to 1250mm.

- Eliminate belt whip, belt twist and belt turn over
- Ideal for drives with pulsating loads
- Available for ISO and RMA pulleys
- Heat and oil resistant

On applications where pulsating or shock loads cause instability in matched sets of Wedge or V-belts, Fenner Banded belts can provide the ideal solution.

By joining together a number of belts with a tie band the banded belt has sufficient lateral rigidity to eliminate problems caused by belts whipping or turning over, and by keeping the belts running into the grooves in a straight line excessive jacket wear is avoided resulting in longer belt life.

Fenner Banded belts can be used in Fenner Taper Lock pulleys manufactured to ISO standards but they are also available for RMA profile pulleys.

When ordering Banded belts it is important that the correct groove profile is selected. The groove spacing i.e. dimension 'e' is given in the following table.

Belt section	Pulley types	e (mm)
SPZ	ISO standard only	12.0
SPA		15.0
SPB		19.0
SPC		25.5
9J (Alpha, 3V)	RMA only	10.3
15J (Beta, 5V)		17.5
25J (Delta, 8V)		28.6
HA	RMA only RMA and ISO ISO only	15.9
B		19.0
C		25.5
D		37.0

Note

- 1) Pulleys and belts defined as ISO conform exactly to BS 3790:1981.
- 2) RMA denotes Rubber Manufacturers Association of America standards and often applies to agricultural machinery.

Anti-Static Properties

Fenner Concord Plus banded belts can be supplied with anti-static properties to order.

Tensioning

Banded belts should be installed with the same tension as for Power Plus wedge belts (page77).

The Fenner spring plunger belt tension indicator can be used, as for individual belts but with the same setting force MULTIPLIED by the number of belts in a band (2, 3, 4 or 5).

A piece of rigid bar placed across the band width can ensure even deflection of all belts in the band.

SELECTION

- (a) Determine whether any pulsating loads will be present in the drive, which would cause excessive vibration.
- (b) Using the wedge belt selection procedure, pages 38–39, select the number and size of belts and sizes of pulleys to suit the particular drive*.
- (c) Select a banded belt length from page 71 nearest to the length found in step (b).

*RMA wedge belts and HA section V-belts are only intended for replacement purposes. New drives should be designed using ISO wedge or classical section belts. If the exact length is not listed opposite, re-calculate the centre distance using the formula below:-

$$C = A + \sqrt{A^2 - B}$$

where: $A = \frac{L}{4} - 0.3925 (D+d)$

$$B = \frac{(D - d)^2}{8}$$

- C = centre distance in mm
- D = pitch diameter of larger pulley in mm
- d = pitch diameter of smaller pulley in mm
- L = pitch length of belt in mm

It is normal practice to use no more than five belts in one band. Accumulation of manufacturing tolerances on pulley groove pitch (dimension 'e') can result in incorrect belt seating when more than 5 belts are used in a single band.

Therefore when more than 5 belts are needed use two or more bands e.g. :-

- 6 belts - use 2 bands of 3
- 8 belts - use 2 bands of 4
- 9 belts - use 1 band of 4 and 1 band of 5

ORDERING INSTRUCTIONS

When ordering Banded Belts it is important to state the number of belts per band; the section and the belt length as follows:-

- Banded 4 9J 2840 is 4 Banded 9J 2840
- Banded 5 SPB 3170 is 5 Banded SPB 3170
- Banded 2 C 3100 is 2 Banded C 3100

Complete the catalogue codes on page 71 by adding 2, 3, 4 or 5 indicating the number of belts in the band.

- e.g.
- Banded 4 9J 2840 is 212Z02844
- Banded 5 SPB 3170 is 216B03175
- Banded 2 C 3100 is 214C03102

Note: When ordering banded belts it is important to specify the correct pulley groove profile, as ISO and RMA grooves have different spacings (dimension e) for essentially the same belt section.

Fenner® Concord PLUS

Banded Belts

- Perfect solution for eliminating belt whip, belt twist and belt turnover
- Ideal for drives with pulsating loads

V-BELTS FOR RMA & ISO PULLEYS

HA*
13 x 8 mm
Range of pitch lengths 1300–4500
B**
17 x 11 mm
Range of pitch lengths 1310–7000
C**
22 x 14 mm
Range of pitch lengths 1950–10050
D †
32 x 19 mm
Range of pitch lengths 3130–14400

- * RMA Pulleys only
- ** RMA & ISO Pulleys
- † ISO Pulleys only

8 digit catalogue codes are made up in the same style as for wedge belts, but first 3 digits are 214.

Belt lengths are pitch lengths in millimetres.

Other belt lengths may be available – consult your local Authorised Distributor.

Note: The ISO 4184 standard now refers to 'datum' lengths, which are essentially the same as 'pitch' lengths.

PowerTwist Plus belting incorporates the most up-to-date materials available, giving it unique qualities of resistance to many of the adverse working conditions that belts are subject to, and properties that were deficient in earlier designs of link belts. These link belts are complementary to the range of Fenner wedge and V-Belts and are extensively used in industrial, marine, agricultural and heating & ventilation applications.

ADVANTAGES OF POWERTWIST LINK BELTS

Adjustable to any length, adaptable to any drive

Fit the belts to the drive, not the drive to the belts.

Drive elements can be located most effectively and belts installed without removing bearings.

No Slippage

Quick, easy length adjustment minimises belt creep to guarantee full speed and full productivity of machines.

Minimum Inventory

Four boxes of link belting can replace hundreds of fixed length, endless V-Belts. Boxes can be stored easily, providing simplified visual control of inventory.

Vibration

Fenner link belts are manufactured to extremely close tolerances. The design of the belt significantly reduces transmissible vibrations in some applications.

Long Lasting Construction

The extreme flexibility of these belts greatly reduces belt stress, heat build up and fatigue. The construction of the belts is designed to dissipate heat.

Maximum Power Delivery

On multiple belt drives it is easy to maintain correct tension on all belts. Each belt carries its required load, for maximum power delivery and longest life.

Temperature

Power Twist Plus will operate in temperatures from - 40 to 110°C.

Water, Chemical & Oil Resistance

This belt will not degrade if immersed in water or if in contact with oil, grease, agricultural chemicals and common solvents.

Economical Lengths

PowerTwist belting is also available in economical lengths.

Boxed in 10 metre lengths, ideal for display or mobile maintenance engineers.

SPECIAL TYPES

Double V Section

For use on serpentine drives with both sides of the belt engaging in V pulley grooves.

AA; BB & CC sections.

Ground Round

Designed specifically to replace round profile rubber or leather belts on "rope" drives.

8mm, 9.5mm, 12.5mm, 14mm & 19mm diameters.

High grip, or PTFE top layer coatings available for conveying applications.

PowerTwist Plus® Belting

Section 2

PowerTwist Plus link V-Belts are manufactured from an exclusive, high strength urethane/polyester composite. This makes PowerTwist Plus an incredibly strong, yet flexible belt that will take on the roughest of working conditions.

PowerTwist Plus V-Belt's unique cross-lock design gives a raw edge cog construction which provides excellent durability and performance, delivering higher power ratings than almost any other link type V-Belts on the market. When the tension is applied to the belt, the cross-link design locks tightly thus producing the lowest stretch of any link V-Belt.

PowerTwist Plus V-Belts save time on installation because no special tools are required, all that is needed is a quick twist both to couple or uncouple the belt and this is easily achieved in seconds.

Available from stock in Z, A, B and C sections, for use in standard dual groove pulleys. See pages 60-67.

SELECTION

To design a Fenner PowerTwist Plus drive simply refer to the wedge belt selection procedure (pages 38-39) utilising the power ratings given above.

For applications that would benefit from the advantages of modern link belting, but require SP (wedge) type belt ratings, consult your local Authorised Distributor.

INSTALLATION

See page 78

Adjustable Pitch Pulleys & Bi-Loc Pulleys

GENERAL

The LP adjustable pulley is used in conjunction with standard Taper Lock dual groove pulleys, pages 60-69, and Fenner Classic V-belts to allow small adjustments to driven speed from fixed speed prime movers.

CONSTRUCTION

Made from grey cast iron, these pulleys have one fixed flank, and an opposite flank which can be adjusted by screw thread, with the drive stationary, and then fixed in position.

INSTALLATION & USE

Pulleys are supplied pilot bored for reboring/ keywaying as appropriate.

Drive centre distance adjustment is used to maintain correct belt tension if pulley diameter is changed.

Note that the belt centre line shifts when diameter changes. Driven pulley may need realignment.

DIMENSIONS OF LP ADJUSTABLE PULLEYS

Catalogue Code	Pulley Designation	Belt Section	Max PCD	Min PCD	A	D	Min bore	Max bore

For other than smooth load 10 hours per day applications, the above powers should be derated by 25%.

BI-LOC PULLEYS

The Fenner Bi-Loc system employs lightweight cast iron pulleys with 'Quadruple Duty' Grooves for A/SPA and B/SPB section belts. Twin-tapered steel bushes with metric and Imperial bores are used to mount single, double or different diameter pulleys on one shaft. A shrink-on fit is achieved without keys or grub screws. Only a spanner is needed for fitting and removal.

- Mount single, double or different diameter pulleys on one bush.
- Use retainer and screws for single pulley assembly.
- Use bolts for double groove pulley assembly.

Pitch Diameter		Outside Dia. †	Bush No

URETHANE BELTING

- Very high coefficient of friction.
- Reinforced urethanes with high load carrying capacity.
- High chemical resistance
Heat, moisture and ultra-violet light resistant.
- Wide range of sections and material types available.
- Useful for power transmission and conveyor applications.
- Customised design available in-house
- Most materials FDA/USDA approved
- Joined by butt or overlap welding or special metal fasteners.

THE RANGE

- | | |
|-----------------|--|
| Round Section | 2 - 20mm diameter
80, 85, 89, 90, 95 hardness grades
Plain and textured surfaces
'Quick Connect' hollow type with metal fasteners |
| Twisted O Rings | Many colours and clear |
| Other Sections | Trapezoidal 3L,Z, A, B, C, D, E sections
Hexagonal AA, BB sections
Crown top, ridge top, ribbed top, ribbed back etc, |
- Many colours
Solid PU or textile reinforced

APPLICATIONS

- Conveying light or delicate products
- Light power transmission
- Can-cable for canning lines
- Driving conveyor rolls
- Conveying abrasive materials

BUTT WELDING KITS

- Includes clamps, hot knife (240v - 110v available), flash cutter, shears - in a handy carrying case
- Overlap welding kit also available

NOTE: Quantity requirements can be supplied ready welded to size.

"ONE SHOT" TENSIONING

Fenner **FB** belts are Precision Built to ensure inherent length stability and matching during storage and on the drive. Over many years, the principle of "one-shot" tensioning has been verified by successful drives the world over.

- Install the belts to be a snug fit around the pulleys.
- Spin the pulleys 3-4 revolutions to bed belts into the pulley grooves. (Note: if done manually, beware of finger entrapment between belts and pulleys)
- Tension the belts to the 1.25x setting forces from the table.
- Run the drive under load for 15-20 minutes.
- Stop the drive, check tension & reset to the basic value (standard V and wedge belts) if necessary. CRE Plus & Quattro Plus belts should be reset to the 1.25x value.

With a drive that is properly designed for the application there should be no need for further attention during the life of the belts.

For short centre distance drives where the deflection of the belt is too small to measure accurately it is recommended that both deflection and setting force be doubled.

Method of belt tensioning using Fenner Belt Tension Indicator

- Calculate the deflection in mm on a basis of 16mm per metre of centre distance. Centre distance (metres) x 16 = deflection (mm).
- Set the lower marker ring at the deflection distance required in mm on the lower scale.
- Set the upper marker ring against the bottom edge of the top tube.
- Place the belt tension indicator on top of the belt at the centre of span, and apply a force at right angles to the belt, deflecting it to the point where the lower marker ring is level with the top of an adjacent belt.
- Read off the setting force value indicated by the top edge of the upper marker ring.
- Compare this force to the kgf value shown in the table.
- If a Fenner Belt Tension Indicator is not available, a spring balance and rule will suffice.
- With banded belts (pages 70 and 71) use a bar across the band width to ensure even distribution of the force and **DIVIDE** the force measured by the number of belts in the band for comparison with the values in the table above. Alternatively, for the same deflection, use a setting force from the table above **MULTIPLIED** by the number of belts in the band.

BELT TENSION INDICATOR APPLIES SETTING FORCE AT MID CENTRE DISTANCE

The setting forces below are designed to cover a wide range of drives. A precise setting force for individual applications can be calculated. Please consult your local Authorised Distributor or use the 'Fenner Select' design software at www.fptgroup.com

SETTING FORCES

Belt Section	Setting force to deflect belt 16 mm per metre of span				
	Small pulley diameter (mm)	Basic setting forces Newtons (N) kilograms (kgf)		1.25 x setting forces Newtons (N) kilograms (kgf)	
SPZ	56 to 71	16	1.6	20	2.0
	75 to 90	18	1.8	22	2.2
	95 to 125	20	2.0	25	2.5
XPZ & QXPZ	over 125	22	2.2	28	2.8
	80 to 100	22	2.2	28	2.8

SPB, HSPB XPB & QXPB	112 to 160	40	4.0	50	5.1
	170 to 224	50	5.1	62	6.3
	236 to 355	62	6.3	77	7.9
	over 355	65	6.6	81	8.3
SPC, HSPC & QXPC	224 to 250	70	7.1	87	8.9
	265 to 355	92	9.4	115	12.0
	over 375	115	12.0	144	15.0
8V	335 & above	150	15.0	190	19.0
Z	56 to 100	5 to 7.5	0.5 to 0.8		
A (& HA banded)	80 to 140	10 to 15	1.0 to 1.5		
B	125 to 200	20 to 30	2.0 to 3.1		
C	200 to 400	40 to 60	4.1 to 6.1		
D	355 to 600	70 to 105	7.1 to 10.7		

FENNER BELT TENSION INDICATOR

NOTES:

For single belt drives a straight edge should be placed across the two pulleys to act as a datum for measuring the amount of deflection.

If the measured force falls within the values given, the drive should be satisfactory. A measured force below the basic value indicates under-tensioning.

A new drive should be tensioned to the 1.25x value to allow for the normal drop in tension during the running-in period.

After the drive has been running for 15-20 minutes, under load the tension should be checked and re-adjusted, if necessary.

TROUBLE SHOOTING

Small radial cracks on belt side and base

Generally caused by slippage due to insufficient belt tension, but excessive

heat and/or chemical fumes can also cause the same problem.

Belt swelling or softening

Caused by excessive contamination by oil, certain cutting fluids, water or rubber solvent.

Whip during running

Often caused by incorrect tensioning, particularly on long centre drives. If a slightly higher (or lower) tension does not cure the problem there may be a critical vibration frequency in the system which requires re-design or use of banded belts. Consult your local Authorised Distributor Technical Services.

Pulleys

Pulley groove wear can cause rapid belt failure. Check grooves for wear with a Fenner groove gauge.

Installation and Operaton of Wedge & V-Belt Drives

Although comparatively old in principle today's belt drive is an extremely efficient method of transmitting power between prime mover and machinery.

It owes its present high performance standards to many years of research and development by engineers and technologists, leading to significant refinements in materials and processes. To derive maximum benefit from such advances it is important that the simple installation and operation procedures set out here are closely followed. Making these routines standard practice will ensure optimum performance and long, trouble-free life from Fenner belt drives.

INSTALLATION

■ PULLEYS

Before assembling the drive, check the pulley grooves are free from scores or sharp edges, and all dimensions conform to the relevant standard.

Drive installation is straightforward with Taper Lock – but follow all steps on the installation leaflet provided with every Taper Lock bush.

■ ALIGNMENT

Good alignment of pulleys is important to avoid belt flank wear. The diagrams opposite show some of the common alignment faults.

Pulley misalignment should not exceed 1/2 ° angular and 10mm / metre drive centre distance, axial.

A laser alignment device is available, which facilitates quick, easy and accurate pulley alignment - consult your local Authorised Distributor.

■ BELT INSTALLATION

When the pulleys have been correctly positioned on the shafts, the belts can be installed to complete the drive.

The drive centre distance should be reduced prior to the installation of the belts so that they may be fitted without the use of force. Under no circumstances must belts be prised into the grooves. Belts and pulley grooves can easily be damaged by using sharp tools to stretch the belts over the pulley rim.

The installation allowance given in the table opposite is the minimum recommended reduction in centre distance for the various belt sections and lengths to allow for correct fitting.

The take-up allowance given in the same table should be added on to the calculated centre distance to allow for belt stretch/bedding in.

■ GUARDS

Where guards are necessary it is desirable to use mesh materials to permit adequate ventilation.

Guards should be generously sized to allow for incidental belt flap.

■ TENSIONING PULLEYS

If tensioning (jockey) pulleys are to be used on wedge belt drives, they must be grooved pulleys working on the inside of the drive, preferably on the slack side. The pulley should be positioned as close as possible to the large pulley. Flat tensioning pulleys, bearing on the outside of the drive are permissible only with V and not with wedge belts. They should be positioned within one third of the centre distance from the small pulley.

The tensioning pulley must have at least the same diameter as the small pulley of the drive.

Tensioning pulley movement must allow for passing the belts over the outside diameter of one of the drive pulleys on installation, and should also allow for belt stretch/bedding in.

The modern wedge belt drive is a highly efficient power transmission medium, but optimum performance will not be achieved without correct tension and alignment.

INSTALLATION AND TAKE-UP ALLOWANCE						
Belt Pitch Length (mm)	Installation Allowances					Take-up (mm)
	SPZ Z	SPA A	SPB B	SPC C	8V D	
410 to 530	20	25	30	50	65	5
530 to 840						10
850 to 1160						15
1170 to 1500						20
1510 to 1830						25
1840 to 2170						30
2180 to 2830						40
2840 to 3500						50
3520 to 4160						60
4170 to 5140						70
5220 to 6150	20	25	30	50	65	85
6180 to 7500						105
7600 to 8500						125
8880 to 10170						145
10600 to 12500						175

TAPER LOCK

All Fenner V and wedge belt pulleys use Taper Lock shaft fixing.

Detailed instructions for fitting and dismantling Taper Lock products are included with Taper Lock bushes.

1. HOW TO MEASURE

Correct way to measure:
PowerTwist Plus – end of tab to first empty holes (right to left, above)

Determine the required pitch length of the belt. Measure PowerTwist Plus from the second empty hole on the last link to the end tab. Subtract one link in every 24 for Z, A, B sections, one link in every 20 for C section. For multiple belt drives, count the number of links in the initial belt and make additional belts the same number of links. Lay the original belt on a table and lay the additional belts side by side to ensure the correct length and matched sets.

2. ASSEMBLY – POWERTWIST PLUS

Always work with the belt inside out, tabs pointing outward

Place end tab through two links at once.

Flex belt further and insert second tab through end link by twisting tab with thumb.

Ensure tab returns to position across belt. Reverse belt so tabs run inside.

3. INSTALLATION

Make PowerTwist Plus belts to the correct pitch length and then install them as you would an endless belt.

1. Move motor to reduce centre distance.
2. Place all belts in correct position.

Where it is necessary to thread belts through confined spaces, or around shafts without moving bearings, it is possible to make the belts "in site". Some reduction in pulley centre distance is still necessary for ease of assembly.

3. Move motor back into position, applying correct tension.
4. Secure motor tightly.

Method of Belt tensioning using Fenner Belt Tension indicator

1. Calculate the deflection distance in mm on a basis of 16mm per metre of span.
Centre Distance (m) x 16 = Deflection (mm)
2. Set the lower marker ring at the deflection distance required in mm on the lower scale.
3. Set the upper marker ring against the bottom edge of the top tube.
4. Place the belt tension indicator on top of the belt at the centre of span, and apply a force at right angles to the belt deflecting it to the point where the lower marker ring is level with the top of an adjacent belt*.
5. Read off the force value indicated by the top edge of the upper marker ring.
6. Compare this force to the kgf value shown in the table opposite.
7. If a Fenner Belt Tension Indicator is not available, a spring balance and rule will suffice.

CAUTION

When properly installed, initial tension may appear excessive. Tension drops to normal when drive begins to run.

5. DISASSEMBLY – PowerTwist Plus

Turn belt inside out with tabs pointing outwards. Bend back as far as possible; hold with one hand. Twist one tab 90° parallel with slot.

Pull end of link over tab.

Rotate belt end with tab at 90° to line of belt.

Pull belt end through two links.

4. RETENSIONING

It is important to retension all drives after an initial run-in period. On fixed centre drives, it may be necessary to remove a link from each belt for proper retensioning.

TENSIONING FORCES

Belt Section	Force required to deflect belt 16mm per metre of span		
	Small Pulley Diameter (mm)	Newton (N)	Kilogram-force (kgf)
Z	56 to 90	10 to 15	1.0 to 1.5
A	80 to 140	15 to 20	1.5 to 2.0
B	125 to 200	25 to 35	2.6 to 3.6
C	200 to 400	45 to 65	4.6 to 6.6

***NOTE:** For single belt drives a straight edge should be placed across the two pulleys to act as a datum for measuring the amount of deflection.

If the measured force falls within the values given, the drive should be satisfactory. A measured force below the lower value indicates under-tensioning.

A new drive should be tensioned to the higher value to allow for the normal drop in tension during the running-in period.

After the drive has been running for 30 minutes, the tension should be checked and re-adjusted to the higher value, if necessary.

Ribbed Belts

BELT DIMENSIONS & PHYSICAL PROPERTIES

Belt Section	PJ	PK	PL	PM
Rib pitch E (mm)	2.34	3.56	4.70	9.40
Belt thickness H (mm)	3.50	5.00	7.00	12.00
Mass/unit length/rib (g/m/rib)	8.20	19.50	32.00	110.00
Maximum belt* speed (m/sec)	60.00	55.00	50.00	40.00
Minimum pulley diameter (mm)	18.00	50.00	70.00	180.00

* Belt speeds above 40m/sec require special pulley materials – consult your local Authorised Distributor

The geometry of each section complies with ISO 9982.

STANDARD EFFECTIVE LENGTHS (MM & INCHES)

1992	78.5						
2083	82.0						
2210	87.0						

Effective belt lengths are used with pulley effective diameters in all centre distance calculations.

All the above belts can be supplied with rib numbers of at least 46.

Intermediate belt lengths are available - consult your local Authorised Distributor.

Belts should be designated by: number of ribs, section letters and effective length in mm

(e.g. 16 PL 2235)

Ribbed belt codes

Digits	Reference	Code
1,2&3	Product group	215
4	Belt section PJ,PK,PL,PM	J,K,L,M
5,6,7,8	Belt effective length mm e.g. 723mm=0723 1295mm=1295 for M section over 10000 use 1st 4 digits e.g. 12217mm =1221	0200 -9999

NOTE:

These 8 digit codes specify the section and effective length of a belt.

The number of ribs on any belt must be specified separately.

e.g. 16 PL 2235 = 215 L 2235, 16 ribs

Necessary drive data: Driving/driven shaft speeds (rev/min), absorbed drive power and/or motor power (kW), type of prime mover (inc. electric motor starting arrangements) and driven machine, machine shaft diameters (mm or ins.), required drive centre distance (mm), any other dimensional constraints.

(a) Service Factor

Select the service factor applicable to the drive from table 1 below. For a speed increasing drive multiply the basic service factor by the special factor in the top left box to achieve the full service factor.

(b) Design Power

Multiply the normal running (absorbed) power of the drive, or if not known, the motor power, by the service factor (a), to give the design power which is used as the basis for drive selection. This power should be calculated in kW.

(c) Ribbed Belt Section

Refer to table 2, page 81 and find the point of intersection of the faster drive shaft speed in rev/min, and the design power (b). This point will indicate required belt section and approximate small pulley diameters/rib numbers.

NOTE: PK section ribbed belts are normally used for automotive applications. For general industrial applications PJ, PL or PM section belts should be selected.

(d) Speed Ratio

Divide rev/min of faster shaft by that of the slower shaft to give required speed ratio.

(e) Minimum Small Pulley Diameter

Refer to table 5, page 81 to find the minimum recommended small pulley diameter, using design power (b) and the faster shaft speed.

(f) Pulley Effective* Diameters

Refer to table 6, page 82 to select pulley effective diameters giving close to the required speed ratio (d), using (e) as a guide to small pulley diameter.

Calculate the exact speed ratio and check acceptability

* Note: All pulley designations show effective (outside) diameters. Exact speed ratios are calculated using pitch diameters, - see under table 6, page 82.

(g) Belt Length and Centre Distance

Use the formulae below to establish which standard belt length (listed page 79) gives closest to the required drive centre distance.

(h) Combined Correction Factor

Refer to tables 3 & 4, page 81 to find power correction factors for belt length and for the arc of contact for the small pulley (the latter calculated using pulley diameters D & d, and centre distance C - all in mm).

Multiply these two factors together to give the combined correction factor.

(j) Basic/Additional Power per Rib

The main power rating tables on pages 82 & 83 show basic power per belt rib, in kW, at the intersection of faster shaft speed (LH column, in rev/min) with pulley diameter (across top, in mm). Additional power per rib due to speed ratio is shown in the smaller RH table. Values for shaft speeds not listed can be derived by interpolation.

(k) Corrected Power per Rib

Add the speed ratio increment to the basic power per rib (j) and multiply the resultant kW value by the combined correction factor (h) to give the full power per rib.

(l) Number of Ribs Required

Divide design power (b) by the full power per rib (k) to give the number of belt ribs required. Round up to an even number and check whether standard pulleys are available.

(m) Pulleys

When pulley specification is established, consult your local Authorised Distributor to check availability of pulleys with Taper Lock bush shaft fixing, and associated bore size capacity.

BELT LENGTH & CENTRE DISTANCE FORMULAE

To determine belt length (L mm) for a given centre distance (C mm) using pulleys with small/large effective diameters d/D mm:

$$L = 2C + \frac{(D-d)^2}{4C} + 1.57(D+d)$$

-select the standard belt length nearest to L as calculated.

To determine centre distance for given effective pulley diameters and actual belt length:

$$C = A + \sqrt{A^2 - B}$$

where: $A = \frac{L}{4} - 0.3925(D + d)$ and $B = \frac{(D-d)^2}{8}$

TABLE 1: SERVICE FACTORS

SPECIAL CASES		TYPES OF PRIME MOVER					
		'Soft' starts			'Heavy' starts		
For speed increasing drives of: Speed ratio 1.00 – 1.24 multiply service factor by 1.00 Speed ratio 1.25 – 1.74 multiply service factor by 1.05 Speed ratio 1.75 – 2.49 multiply service factor by 1.11 Speed ratio 2.50 – 3.49 multiply service factor by 1.18 Speed ratio 3.50 and over multiply service factor by 1.25		Electric motors: AC – Star delta start DC – Shunt wound Internal combustion engines with 4 or more cylinders All prime movers fitted with centrifugal clutches, dry or fluid couplings or electronic soft start devices			Electric Motors: AC – Direct-on-line start DC – Series & compound wound Internal combustion engines with less than 4 cylinders Prime movers not fitted with soft start devices		
		Hours per day duty					
		TYPES OF DRIVEN MACHINE		10 and under	Over 10 to 16	Over 16	10 and under
Class 1 Light Duty	Agitators (uniform density), blowers, exhausters and fans (up to 75 kW), centrifugal compressors and pumps, belt conveyors (uniformly loaded).	1.0	1.1	1.2	1.1	1.2	1.3
Class 2 Medium Duty	Agitators and mixers (variable density), blowers, exhausters and fans (over 75 kW), rotary compressors and pumps (other than centrifugal), belt conveyors (not uniformly loaded), generators and exciters, laundry machinery, lineshafts, machine tools, printing machinery, sawmill and woodworking machinery, screens (rotary).	1.1	1.2	1.3	1.2	1.3	1.4
Class 3 Heavy Duty	Brick machinery, bucket elevators, compressors and pumps (reciprocating), conveyors (heavy duty), hoists, mills (hammer), pulverisers, punches, presses, shears, quarry plant, rubber machinery, screens (vibrating), textile machinery.	1.2	1.3	1.4	1.4	1.5	1.6
Class 4 Extra Heavy Duty	Crushers (gyratory-jaw roll), mills (ball-rod-tube).	1.3	1.4	1.5	1.5	1.6	1.8

The above chart gives approximate speed ratios between pulleys of the shown effective diameters. For exact drive ratio values, calculate the mathematical ratio between any 2 effective dias. (De) converted to pitch dias. (Dp) as follows: J section $D_p = D_e + 2 \text{ mm}$
L section $D_p = D_e + 5 \text{ mm}$

PJ RIBBED BELT RATINGS

The following recommendations for installing a ribbed belt drive will help ensure correct working conditions and optimum service life.

RIBBED BELT PULLEY GROOVE DIMENSIONS

Pulleys are manufactured to ISO 9982 – Pulleys and V-Ribbed Belts for Industrial Applications

PULLEY SECTION		PJ	PK	PL	PM
α	(°)	40 ± 0.5	40 ± 0.5	40 ± 0.5	40 ± 0.5
P	(mm)	2.34 ± 0.03	3.56 ± 0.05	4.70 ± 0.05	9.40 ± 0.08
Tolerance for ΣP		± 0.3	± 0.3	± 0.3	± 0.3
rt min.	(mm)	0.20	0.25	0.40	0.75
rb max.	(mm)	0.40	0.50	0.40	0.75
f min.	(mm)	1.8	2.5	3.3	64
dB	(mm)	1.5 ± 0.01	2.5 ± 0.01	3.5 ± 0.01	7.0 ± 0.01
2X	(mm)	0.23	0.99	2.36	4.53

SHAFT ALIGNMENT

The maximum axial misalignment allowed is 3 mm per metre centre distance, to a maximum of 15 mm.

Make sure that angular misalignment is kept within 2°. With flat pulleys, acting as idlers for power take-off, do not exceed 1°.

A laser alignment device is available, which facilitates quick, easy and accurate pulley alignment - consult your local Authorised Distributor.

TENSIONING THE BELT

Ribbed belts must be tensioned correctly and with great care. Under or over-tensioning can cause functional problems and lead to premature belt failure. We recommend the elongation method, which is simple and requires no special equipment, in most cases. (For narrow belts - less than 40 mm wide - it is possible to use the Fenner Belt Tension Indicator).

1. Fit the belt on the pulleys with no tension,
2. Draw two lines perpendicularly across the belt back approx 80% of the belt span apart (or one metre apart for very long spans),
3. Increase the distance between the two lines by 0.5 to 0.75% i.e. by 5 to 7.5 mm for an initial spacing of 1000 mm.
4. Run the drive under load for about 10 minutes,
5. Check the tension of the belt (i.e. the spacing between the two lines) and readjust if necessary.

GENERAL

Pulleys should be mounted as close as possible to bearings, to reduce overhung load.

Pulley grooves should be in good condition, clean, and free from sharp edges.

Ensure that drive machinery is securely fastened after belt installation or adjustments.

Guards should be generously sized and well ventilated.

CENTRE DISTANCE ADJUSTMENT: FITTING AND TAKE-UP RECOMMENDATIONS

Belt Length (mm)	PJ		PK		PL		PM	
	M	T	M	T	M	T	M	T
> 750	-10	+10	-11	+13				
750 to 1200	-10	+15	-12	+16	-15	+20		
1200 to 2000	-15	+20	-16	+22	-20	+25		
2000 to 3500	-20	+30	-23	+32	-30	+35	-40	+50
3500 to 6000					-40	+50	-50	+70
> 6000							-100	+130

TAPER LOCK

Ribbed belt pulleys are available using Taper Lock shaft fixing.

For detailed instructions on the fitting and dismantling of Taper Lock products see Shaft Fixings page 126-127. (TBC)

Fenner®

SYNCHRONOUS BELT DRIVES

This state of the art, integrated range of synchronous belt drive components is capable of meeting almost any applicational requirement.

- Comprehensive range of belt styles including timing belts, HTD belts and Torque Drive Plus 3 (TDP3)
- TDP3 anti-static as standard
- Absolute drive synchronism - no slippage
- Stock sizes to suit all applications
- ISO compliance

Synchronous Belt Drives Design Data Required

- Type of prime mover, or driving m/c
- Electric motor starting arrangement
- Rotational speed of prime mover
- Power rating of prime mover
- Type of driven machine
- Rotational speed of driven machine
- Power absorbed by driven machine
- Hours/day duty & start/stop frequency
- Both driven & driver machine shaft diameters
- Centre distance & space restraints
 - fixed centres?
- Space restraints
- Any environmental issues
 - ambient temperature
 - noise limits
 - water, oil mist etc.

Torque Drive PLUS[®] 3

Fenner[®]

The compact, quiet, powerful solution

The outstanding performance of this third generation belt drive delivers load transmission similar to a chain drive but with less noise, no lubrication, and on standard HTD pulleys.

Manufactured using the latest materials and production technology, Fenner Torque Drive PLUS 3 continues to push the boundaries of possibility.

- Delivers the highest power rating from a rubber/glass fibre belt construction
- Compact drive packages
- Offers minimum backlash for precise positioning
- Operates with minimum noise levels
- Runs optimally on standard HTD pulleys

www.fptgroup.com

Drive Package Comparison

Torque Drive PLUS 3 belts allow design of lighter, more compact, more cost effective drive packages.

COMPARISON OF HTD, TORQUE DRIVE PLUS3 DRIVE POWER RATINGS

Small Pulley/Faster Shaft Speed – rev/min

3
Section

A Helically wound glass-fibre tensile member gives high tensile modulus and excellent fatigue life.

B Flexible, durable chloroprene backing polymer, encapsulates the tensile cords and protects them from contaminants and mechanical damage e.g. from idler pulleys on the back of the belt.

Torque Drive PLUS[®] 3

C Belt teeth are precisely formed and accurately spaced to ensure quiet, efficient engagement with pulley grooves.

They are made of medium hardness chloroprene and are bonded integrally with the belt backing.

D Low friction woven nylon facing protects tooth surfaces from wear and aids quiet, efficient running.

SYNCHRONOUS BELT DRIVES

TORQUE DRIVE PLUS 3 BELTS

The three principal dimensions of a belt are:

pitch **pitch length** **width**
and are used in this order as a designation e.g. 8MXP-1120-30.

Belt pitch is the distance in millimetres between two adjacent tooth centres as measured on the pitch line of the belt.

Belt pitch length is the total length of the belt (circumference) in millimetres as measured along the pitch line. The theoretical pitch line of a belt lies within the tensile member.

TEMPERATURE

Torque Drive Plus 3 belt performance is generally unaffected in ambient temperatures between -25°C and +100°C. Temperatures beyond these extremes should be referred to your local Authorised Distributor.

ANTI-STATIC AS STANDARD

FennerTorque Drive PLUS 3 belts are static conductive to the definitive ISO 9563 standard.

TDP3 DRIVE SELECTION PROCEDURE

1) Determine Drive Requirements

- The nature of the driving machine (usually the prime mover) and the driven machine and the duty cycle in hrs./day.
- The rotational speeds of the driving and driven machines.
- The power capability and starting arrangements of the prime mover and the power absorbed by the driven machines.
- The required drive centre distance and the machine shaft diameters.

2) Calculate Design Power

Select a service factor from the table – page 90. Include an additional factor if the drive is speed increasing.

Multiply normal running (absorbed) power by the service factor to give **design power – kW**.

3) Belt Pitch

Use the **belt pitch** selection guide - page 89 to select 8mm or 14mm pitch according to the point of intersection of the small pulley (faster shaft) rotational speed and the design power.

If the intersection lies close to the 8/14mm pitch boundary, either pitch may be appropriate, attempt the design procedure on 8mm pitch first but be aware that later criteria may make 14mm necessary.

4) Speed Ratio

Divide the rotational speed of the faster shaft (rev/min) by that of the slower shaft to determine **speed ratio**.

5) Pulley Selection

Refer to the drive tables (pages 96 to 101) for the appropriate belt pitch. From the first column select the required speed ratio and consult the next two columns for appropriate **pulley groove numbers**.

Where alternative groove number pairs are available be aware that criteria in steps 6 & 7 may influence the ultimate selection.

Consider any drive dimensional limitations by reference to pulley dimension tables on pages 102 to 104, noting that pulleys with up to 72 grooves may have flanges that determine the o/dia.

6) Belt Length & Centre Distance

Read along the line in the drive table for the selected pulley groove number pair and select the centre distance closest to that required. The standard **belt length** giving that **centre distance** is at the head of the column.

If centre distance is critical, be aware that alternative groove number pairs may offer a closer value with standard belt lengths.

7) Power Rating & Belt Width

Refer to the **power rating** table on page 89 for the chosen belt pitch, locate the small pulley groove number/rotational speed combination, and note the **power rating** (for the narrowest standard belt width).

Multiply this rating by the belt length factor for the chosen belt length, from the listing beneath the main table.

Divide the **design power** by the length corrected power rating, to give required belt width factor. Refer to the width factors below the rating table and select the belt width with a factor equal to or greater than required.

8) Shaft Sizes

Check the **bore capacity** of the chosen pulleys against the pulley dimension tables on pages 102 & 104.

If the pulleys will not accommodate the drive **shafts** it will be necessary to consider other pulley combinations, possibly using an alternative belt pitch.

NOTE

An optimum drive will use a belt of width factor just greater than that required. If alternative groove number pairs can give close to the required speed ratio, slightly larger pulley groove numbers may allow a narrower belt, or slightly smaller groove numbers may be possible with the same belt width. Larger diameter pulleys typically reduce bearing and shaft loads. Avoid drives where the belt width exceeds the small pulley diameter.

EXAMPLE

1) Drive Requirements

- AC cage rotor electric motor driving to a rotary gear pump. 24 hr/day.
- 1450 rev/min motor, pump to run at 740rev/min +/-5%.
- 60 kW motor, soft start – no pump absorbed power given.
- Centres 800/850mm, motor shaft 60mm, pump shaft 75mm.

2) Design Power

Service factor for medium duty, soft start, 24 hr/day = 1.7.

Design power = 1.7 x 60 = 102 kW.

3) Belt Pitch

Pitch selection chart shows intersection of 1450 rev/min and 102 kW to be within the capability of 14mm pitch.

4) Speed Ratio

1450/740 = 1.97:1

A 2:1 ratio satisfies the +/-5% criterion.

5) Pulley Selection

From page 100, 32 to 64 grooves is one combination giving 2:1 ratio.

6) Belt Length & Centre Distance

A belt length of 2310mm gives centres of 816mm.

7) Power Rating & Belt Width

The power rating table shows a value of 46.74 kW for a 32 groove pulley at 1450 rev/min for a 40mm wide belt.

Belt length factor for a 2310mm belt = 1.0 - no change to power ratings.

102/46.74 = 2.18. Next larger standard width factor = 2.31 for 85mm wide belt.

8) Shaft Sizes

The 32-14M-85 pulley uses a 2517 Taper Lock bush, max. bore 60mm – OK.

The 64-14M-85 pulley uses a 3525 Taper Lock bush, max. bore 100mm – OK.

DRIVE SPECIFICATION

Motor pulley:	32-14M-85 HTD pulley.
Taper Lock bush:	2517/60mm.
Driven pulley:	64-14M-85 HTD pulley.
Taper Lock bush:	3525/75mm.
Belt:	14MXP - 2310-85 Torque Drive Plus 3 belt.

DRIVE ORDERING INSTRUCTIONS

A complete drive usually consists of five components:

two pulleys, two Taper Lock bushes & one belt.

- Pulleys. Standard HTD pulleys. Codes are shown on the dimension tables, pages 102 to 104
- Taper Lock bushes. Bush sizes are shown on the pulley dimension tables. Bush codes are on Shaft Fixings pages 126 & 127.
- Belts. Belt codes are shown on page 87.

The drive selection above would be ordered as:

Driving pulley	32-14M-85	Code 043R0032.
Taper Lock bush	2517/60mm	Code 029M0060.
Driven pulley	64-14M-85	Code 043R0064.
Taper Lock bush	3525/75mm	Code 029J0075.
Belt	14MXP-2320-85	Code 286R0231.

BELT DIMENSIONS

5M HTD

8MXP & 8M HTD

14MXP & 14M HTD

PULLEYS

The three principal dimensions of a pulley are:

number of grooves pitch width

and are used in this order as a designation e.g. 72-8M-50.

On the pulley, pitch is the distance between groove centres and is measured on the pulley pitch circle.

The pitch circle of the pulley coincides with the pitch line of the belt running in it. The pulley pitch diameter is always greater than its outer diameter.

Torque Drive Plus 3 belts run with standard Fenner Taper Lock HTD pulleys.

Standard pulley dimensions are listed in the tables on s 102 to 104.

FENNER HTD

This development of the original Timing Drive is offered in a range of pitches 5mm, 8mm and 14mm. Comprehensive choice of belt widths and lengths combine with an optimised range of Taper Lock pulleys to suit general industrial needs.

Drives can be designed by simple catalogue selection methods to give more compact drives, less noise and lower bearing loads than with classical Timing Drives.

The Fenner HTD drive system conforms to the ISO 13050 standard

Fenner HTD drives offer the technical and economical benefits of an established product range with proven performance and world wide availability.

Fenner HTD belts have a curvilinear tooth form giving a more uniform distribution of shear stresses within the teeth and a transition of tooth loads to the tensile members in the belt which significantly improves upon classical Timing Belts.

BELT PITCH SELECTION CHART

TEMPERATURE

HTD belt performance is generally unaffected in ambient temperatures between -25°C and +100°C.

Temperatures beyond these extremes should be referred to your local Authorised Distributor.

For storage, belts should be protected from moisture, temperature extremes, direct sunlight and high ozone concentrations.

Belts should be stored avoiding sharp bends or crimping, which would damage the belts.

SELECTION PROCEDURE

(a) Speed Ratio

Divide the rev/min of the faster shaft by the rev/min of the slower shaft to obtain the **speed ratio**.

(b) Service Factor

From the table (page 90) select the **service factor** which is applicable to the drive. If the drive is speed increasing an additional factor may be required.

(c) Design Power

Multiply the normal running power (kW) by the service factor. This gives the **design power** which is used as the basis for selecting the drive.

(d) Belt Pitch

Refer to the belt pitch selection chart on page 91. Choose the recommended **belt pitch** according to the point of intersection of the design power and the rev/min of the faster shaft.

(e) Pulley Selection

Refer to the drive tables (pages 94 to 101) for the pitch of belt selected in (d). From the first column select the required speed ratio. Reading along the same horizontal line the next two columns give the number of grooves on each pulley. Where more than one combination of pulleys is available consult the power ratings tables (page 93) and the list of stock belt widths (page 91). In conjunction with the design power found in (c) determine the most suitable **pulley pair**.

(f) Centre Distance

Using the relevant drive table read along the same horizontal line as that showing the pulley sizes, and select a **centre distance** nearest to that which is required. The belt required to give this centre distance is shown at the head of the column.

(g) Belt Length Correction Factor

From the table on page 93 note the **correction factor** for the pitch and length of belt chosen.

(h) Power Rating

Refer to the Power Ratings on page 93 for the pitch of belt being considered. Read down the left hand column to the speed of the small pulley in rev/min. On this line read across to the column headed by the number of grooves on the small pulley and note the basic power rating. Multiply this figure by the belt length correction factor (g) to obtain the actual power rating.

(j) Belt Width

Divide the Design Power found in step (c) by the actual power rating found in step (h) to obtain the belt width factor. Using the table below the power ratings, select a belt width which has a width factor equal to or greater than the figure found above.

(k) Pulley Bores

Refer to the pulley dimensions (pages 102 to 104) and check that the Taper Lock® Bush sizes in the pulleys selected can accommodate the shafts they are to fit.

(l) Pulley Ranges

If standard pulleys are to be used, (i.e. those combinations shown in the selection tables) on the majority of drives it will be found that at least one pulley is flanged as standard. If non-standard pulleys are to be used (i.e. combinations not shown in the selection tables) one pulley requires to be flanged, and it is usually more economical to flange the smaller one. If the centre distance exceeds 8 times the outside diameter of the small pulley, or if shafts are vertical, both pulleys should be flanged.

EXAMPLE

An HTD drive is required to drive a rotary pump at 685 rev/min. The prime mover is a 30kW, direct-on-line start AC motor, running at 1440 rev/min. The required centre distance is 450mm, and each shaft diameter is 55mm. Continuous duty.

(a) Speed Ratio

$$\frac{1440}{685} = 2.10:1.$$

(b) Service Factor

From table (page 90) the service factor is 1.9.

(c) Design Power

Design Power = 30 x 1.9 = 57kW.

(d) Belt Pitch

From table on page 91, 14M is the most suitable pitch.

(e) Pulley Selection

A speed ratio of 2.11 can be found in the drive tables on page 100 utilising pulleys of 38 and 80 grooves.

(f) Centre Distance

Reading along the same line as the 2.11:1 Speed ratio, a centre distance of 467mm is found, and at the head of the column the belt length given is 1778mm.

(g) Belt Length Correction Factor

From table on page 93 Belt Length Correction Factor = 0.95.

(h) Power Rating

From the power rating table the basic capacity of a 38 groove pulley at 1440 rev/min is 25,70kW/40mm width. Actual power rating = 25.70 x 0.95 = 24.41 kW.

(j) Belt width

$$\text{Belt Width Factor} = \frac{57}{24.41} = 2.33$$

From the width factor table beneath the power rating table it can be seen that the required width is 85mm.

(k) Pulley Bores

From the pulley dimension tables, both pulleys are fitted with Taper Lock® Bushes which will accommodate 55mm bores.

(l) Pulley Flanges

The 38 groove pulley is flanged as standard.

DRIVE SPECIFICATION

38 –14M –85mm
3020/55mm
80 – 14M – 85mm
3525/55mm
1778 –14M –85mm HTD belt giving 467mm centres.

ORDERING INSTRUCTIONS

A complete drive usually consists of five components: two pulleys, two Taper Lock bushes, and one belt.

- (1) **Pulleys.** The eight digit pulley code is given on the dimension pages 102 to 104.
- (2) **Taper Lock Bushes.** The eight digit codes are given on the Taper Lock Shaft Fixings pages 126 & 127.
- (3) **Belt.** The belt code is given on page 91.

Example: The drive selection above would be ordered as :

Driving Pulley	38–14M–85mm	Code 043 R 0038
Taper Lock Bush	3020/55mm	Code 029 P 0055
Driven Pulley	80–14M–85mm	Code 043 R 0080
Taper Lock Bush	3525/55mm	Code 029 J 0055
Belt	1778–14M–85mm	Code 278 R 0177

These pulleys are used for both 15mm wide and 9mm wide belts.

Dimensions in millimetres unless otherwise stated.

* Pilot bore only

Prime functional dimensions are correct at the time of publication.

Pulley types and non-functional dimensions may vary.

FENNER BELT TENSION INDICATOR

The high performance and efficiency of Fenner Synchronous belts requires correct tension. We recommend using the Fenner Belt Tension Indicator.

NOTE: To measure tension in synchronous belts, place a piece of rigid material across the belt width at mid-span, before applying the gauge.

Dimensions in millimetres unless otherwise stated

Taper Lock pulleys for use with 14MXP and 14M belts of 115mm and 170mm widths are available.

Prime functional dimensions are correct at the time of publication.

Pulley types and non-functional dimensions may vary.

CLASSICAL TIMING DRIVES

Components for the original Timing Drive system are still available.

Belts and pulleys for L (Light or 3/8" pitch) and H (Heavy or 1/2" pitch) drives are available from stock as listed on pages 106 to 107 whilst the table below includes XL (eXtra Light) and XH (eXtra Heavy) belts which are readily available but not always from stock.

H pitch belts of 3" width are available but not from stock.

Order by catalogue codes shown on the following tables.

Fenner Timing Belt drive components conform to ISO 5296 and to BS 4548.

Drive powers of up to 50 kW can be accommodated and most of the pulleys use Taper Lock bushes for shaft fixing.

It is anticipated that the great majority of new drive requirements can best be satisfied with one of the more modern synchronous drive systems. Should drive design details be required – consult your local Authorised Distributor

Dimensions in millimetres unless otherwise stated. # These pulleys have spokes instead of plate web centres.
 Prime functional dimensions are correct at the time of publication.
 Pulley types and non-functional dimensions may vary.

INSTALLATION TENSION

Synchronous belt drives operate by positive meshing and do not require high installed belt tensions.

For optimum performance, however, belts should be installed with a pre-tension suitable for the envisaged drive duty, derived from the formulae below.

Where a range is indicated, the lower value will be suitable for lightly loaded, smooth running drives, whereas drives subject to high shock loads and/or frequent starts should be tensioned to the higher level. Belt pre-tension is usually achieved by drive centre distance extension and checked by applying a setting force F (N) at mid belt span sufficient to deflect the belt a distance d (mm) related to the length of the span S (metres).

It is necessary to ensure that the force is applied at right angles to the belt span, and evenly across the belt width.

A Fenner Belt Tension Indicator may be used, in conjunction with a piece of rigid bar laid across the face of the belt at mid-span

An electronic, sonic tension indicator is also available.

TORQUE DRIVE PLUS 3 & HTD DRIVES

(Deflection – d 20mm/metre span length - S)

Calculate the force F from the formulae below.

$$F \text{ (max)} = \frac{kW \times 955,000}{d.n} \quad F \text{ (min)} = \frac{kW \times 477,500}{d.n} \quad (\text{N})$$

- where kW = Motor power, or absorbed power if known
- d = Pitch diameter of either pulley (mm).
- n = Rev/min of same pulley.

TIMING DRIVES

(Deflection – d 20 mm/metre span length - S)

Use force F from the table below.

Belt	F (Newtons)
L050	2.7
L075	4.3
L100	6.1
H075	11.0
H100	15.6
H150	24.3
H200	33.4

NOTE: Excessive belt tension will reduce belt and bearing lives and may increase drive noise levels. For fixed centre applications tension may be applied by an idler pulley (see note on Idler Pulleys) or consult your local Authorised Distributor for precise fixed centre dimensions. Drive support frameworks must be rigid to avoid flexure resulting in centre distance reduction and consequent tooth jumping, particularly on high torque starts.

BELT CARE

Avoid 'crimping' belts.

Folding belts such that they are tightly bent, e.g. for storage, damages the belt cords and will lead to premature failure.

BELT INSTALLATION

Provision should be made for adjustment of the drive centre distance to allow for installation of the belt around the pulleys without damage, and subsequent pre-tensioning. A belt should never be forced over pulley flanges as internal belt damage will result.

The following tables offer guidance as to the necessary adjustments for installation and also for applying appropriate pre-tension.

Centre Distance Allowance (installation on flangeless pulleys, tensioning) mm			Additional Centre Distance Allowance (installation over flanged pulleys) mm		
Belt length (mm)	Installation	Tensioning allowance (any drive)	Belt pitch	One pulley flanged (mm)	Both pulleys flanged (mm)
<1000	1.8	0.8	5mm	14	19
1001 - 1780	2.8	0.8	8mm	22	33
1781 - 2540	3.3	1.0	14mm	36	58
2541- 3300	4.1	1.0	L	25	35
>3300	5.3	1.3	H	32	48

PULLEY ALIGNMENT

Misalignment of drive pulleys results in unequal tension across the belt width and extreme edge wear. Pulley alignment should be proved using a straight-edge or laser device, and shafts checked for parallelism.

Misalignment on any synchronous drive should not exceed 1/4° angular or 5mm/metre centre distance parallel.

Drive support frameworks must be rigid to avoid flexure causing shaft misalignment under drive forces.

Flexure can result in tooth jumping during high torque starts, particularly if misalignment is present.

IDLER PULLEYS

Grooved idler pulleys can be used on the inside of all synchronous belts.

Flat (not crowned) idlers can be used on the outer surface of Classical Timing, HTD and TDP3 belts.

Wherever possible, idlers should operate on the slack span of a belt, and arc of contact should be kept to a minimum.

Idler pulleys should be of equal or greater diameter than the smaller of the drive pulleys.

Spring loaded idler pulleys are not normally recommended.

TAPER LOCK

Most of the synchronous pulleys/sprockets featured in this section use Taper Lock shaft fixing.

For detailed instructions on the fitting and dismantling of Taper Lock products see Shaft Fixings page 129.

Fenner® DRIVE COUPLINGS

Fenner shaft couplings range from highly resilient to totally rigid and are all precision manufactured using high quality ferrous materials and the latest polymer technology.

- Fenaflex tyre couplings from 24 to 14000Nm, standard DBSE spacer variant and ATEX(Ex) approved variant
- HRC resilient, Taper Lock® couplings from 30 to 3150Nm
- Jaw couplings from 0.5 to 840 Nm with incidental misalignment capacity and quick fit spacer variant
- Rigid Taper Lock® couplings in 8 sizes up to 11000Nm

Drive Couplings Design Data Required

- Type of prime mover, or driving m/c
- Electric motor starting arrangement
- Engine or compressor inertia of both machines (MR^2 or GD^2)
- Rotational speed of prime mover
- Power rating of prime mover
- Type of coupled machine
- Power absorbed by coupled machine
- Hours/day duty & start/stop frequency
- Both coupled shaft diameters
- Distance between shaft ends
- Likely machine alignment quality
angular, parallel and axial

The Fenaflex coupling is a highly flexible, torsionally elastic coupling offering versatility to designers and engineers with a choice of flange combinations to suit most applications.

Tyre coupling flanges are available in either F or H Taper Lock™ fitting or pilot bored, which can be finish bored to the required size.

With the addition of a spacer assembly the coupling can be used to accommodate standard distances between shaft ends, (DBSE) facilitating centrifugal pump maintenance.

Fenaflex couplings can accommodate simultaneous maximum misalignment in all planes without imposing undue loads on adjacent bearings and the excellent shock-absorbing properties of the flexible tyre reduce vibration and torsional oscillations.

Fenaflex tyres are available in natural rubber compounds for use in ambient temperatures between -50°C and $+50^{\circ}\text{C}$. Chloroprene rubber compounds are available for use in adverse operating conditions (e.g. oil or grease contamination) and can be used in temperatures of -15°C to $+70^{\circ}\text{C}$. The chloroprene compound should also be used when fire-resistance and anti-static (FRAS) properties are required, and it is this tyre material that is used with specific flange modifications in the ATEX  approved variant.

SELECTION

(a) Service Factor

Determine the required Service Factor from table below.

(b) Design Power

Multiply the normal running power by the service factor. This gives the design power which is used as a basis for selecting the coupling.

(c) Coupling Size

Refer to Power Ratings table (page 111) and from the appropriate speed read across until a power greater than that required in step (b) is found.

The size of Fenaflex coupling required is given at the head of that column.

(d) Bore Size

Check from Dimensions table (page 112) that chosen flanges can accommodate required bores.

EXAMPLE

A Fenaflex coupling is required to transmit 45kW from an A.C. electric motor which runs at 1440 rev/min to a rotary screen for 12 hours per day. The motor shaft is 60mm diameter and the screen shaft is 55mm diameter. Taper Lock is required.

(a) Service Factor

The appropriate service factor is 1.4.

(b) Design Power

Design power = $45 \times 1.4 = 63\text{kW}$.

(c) Coupling Size

By reading across from 1440 rev/min in the power ratings table the first power figure to exceed the required 63kW in step (b) is 75,4kW. The size of coupling is F90 Fenaflex.

(d) Bore Size

By referring to the dimensions table it can be seen that both shaft diameters fall within the bore range available.

SERVICE FACTORS

SPECIAL CASES For applications where substantial shock, vibration and torque fluctuations occur, and for reciprocating machines (e.g. internal combustion engines, piston pumps and compressors) refer to your local Authorised Distributor with full machine details for analysis.	Type of Driving Unit					
	Electric Motors Steam Turbines			Internal Combustion Engines† Steam Engines Water Turbines		
	Hours per day duty			Hours per day duty		
Type of Driven Machine	10 and under	over 10 to 16 incl.	over 16	10 and under	over 10 to 16 incl.	over 16
CLASS 1 Agitators, Brewing machinery, Centrifugal compressors and pumps. Belt conveyors, Dynamometers, Lineshafts, Fans up to 7.5kW. Blowers and exhausters (except positive displacement), Generators.	0.8	0.9	1.0	1.3	1.4	1.5
CLASS 2* Clay working machinery, General machine tools, paper mill beaters and winders, Rotary pumps, Rubber extruders, Rotary screens, Textile machinery, Marine propellers and Fans over 7.5kw.	1.3	1.4	1.5	1.8	1.9	2.0
CLASS 3* Bucket elevators, Cooling tower fans, Piston compressors and pumps, Foundry machinery, Metal presses, Paper mill calenders, Hammer mills, Presses and pulp grinders, Rubber calenders, Pulverisers and Positive displacement blowers.	1.8	1.9	2.0	2.3	2.4	2.5
CLASS 4* Reciprocating conveyors, Gyrotory crushers, Mills (ball, pebble and rod), Rubber machinery (Banbury mixers and mills) and Vibratory screens.	2.3	2.4	2.5	2.8	2.9	3.0

* It is recommended that keys (with top clearance if in Taper Lock bushes) are fitted on applications where load fluctuation is expected.

† Couplings for use with internal combustion engines may require special consideration, refer to pages 114.

The figures in heavier type are for standard motor speeds. All these power ratings are calculated at constant torque. For speeds below 100 rev/min and intermediate speeds use nominal torque ratings.

Maximum torque figures should be regarded as short duration overload ratings for use in such circumstances as direct-on-line motor starting.

All Fenaflex tyre couplings have an angular misalignment capacity up to 4°.

FLEXIBLE TYRE CODE NUMBERS

Unless otherwise specified Fenaflex flexible tyres will be supplied in a natural rubber compound which is suitable for operation in temperatures -50°C to +50°C. A chloroprene compound is available which is Fire Resistant and Anti-Static (FRAS) and has greater resistance to heat and oil.

This is suitable for operation in temperatures -15°C to +70°C. For temperatures outside these ranges – consult your local Authorised Distributor.

The FRAS tyre variant is used with specifically modified metal flanges to create the ATEX  approved variant.

Dimensions in millimetres unless otherwise stated.

§ G is the amount by which clamping screws need to be withdrawn to release tyre.

† J is the wrench clearance to allow for tightening/loosening the bush on the shaft and the clamp ring screws on sizes F40, F50 and F60. The use of a shortened wrench will allow this dimension to be reduced.

¶ M is half the distance between flanges. Shaft ends, although normally located twice M apart, can project beyond the flanges as shown. In this event allow sufficient space between shaft ends for end float and misalignment.

* Mass and inertia figures are for single flange with mid range bore and include clamping ring, screws and washers and half tyre.

‡ For pilot bore 'B' flange code as listed. Flanges are also available finish bored with keyway if required. Bore must be specified on order.

Note: On sizes F70, 80, 100 and 120 the 'F' direction bush is larger than that in the 'H' direction.

Note: Flange assemblies comprise hub, clamp ring and clamp ring screws/washers.

Fenaflex® Spacer Couplings

Fenaflex spacer couplings consist of a Fenaflex tyre coupling (size F40–F140) plus a spacer flange assembly.

They are designed for use on applications where it is an advantage to be able to move either shaft axially without disturbing the driving or driven machine (e.g. centrifugal pump rotors), Fenaflex spacer couplings are primarily designed for standard distance between shaft end dimensions of 80, 100, 140 and 180mm.

SELECTION

1. Select a suitable size of Fenaflex coupling using the method shown on page 110. Read down the first column in table below and locate the size of coupling selected.
2. Read across until the required distance between shaft ends can be accommodated.
3. Note the required spacer coupling designation at head of column.

4. Check from the Spacer Coupling Dimensions table below that the selected spacer/coupling combination can accommodate the machine shaft size.

Note

A full specification comprises:

- 1 x Spacer assembly
- 3 x Taper Lock bushes
- 2 x Fenaflex flanges
- 1 x Fenaflex tyre

Note: Larger sizes of spacer coupling can be manufactured to order. Consult your local Authorised Distributor.

* F40 'B' Flange must be used to fit spacer shaft.

† 'F' Flange must be used to fit spacer shaft.

Fenaflex® Flywheel Couplings

Designed to fit standard SAE and other popular flywheel configurations, these couplings use chloroprene flexible elements and employ standard B, F or H type driven flanges.

All dimensions in millimetres unless otherwise stated.

Driving flange mass & inertia given are for the bolt ring, bolts and half of the element.

Driven flange mass & inertia given are for an assembled flange having a mid range bore or bush and half the element.

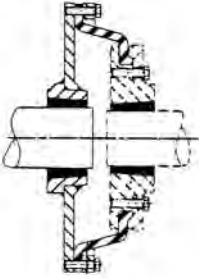

†† J is the wrench clearance to allow for tightening/loosening the bush. A shortened wrench will allow this dimension to be reduced.

* Flywheel fixing screws are not a stock component but should be sourced to the above dimensions, according to thread type used in the flywheel concerned. They should be used with rectangular / square section split washers, respectively.

†W FLANGE—

bolt holes are equi-spaced except size 135W shown

FENAFLEX HIGH SPEED COUPLINGS

Fenaflex flywheel style elements can be deployed to couple a balanced disc with Taper Lock weld-on-hub shaft fixing (effectively replacing the flywheel in the designs illustrated above) to a standard Fenaflex flange, for use at higher rotational speeds.

Consult your local Authorised Distributor for details.

Replacement elements for previously catalogued sizes 192, 213 and 252 are available – Consult your local Authorised Distributor.

Selection of Fenaflex flywheel couplings should take account of design power (using Service Factors on page 110) and speed, and also the torsional characteristics of the coupled machines – consult your local Authorised Distributor.

* Power ratings at other speeds directly proportional to these values.

ALL FENAFLEX COUPLINGS – ORDERING INSTRUCTIONS

SHAFT TO SHAFT COUPLING USING FLEXIBLE TYRE.

Consists of:

2–Flanges (page 112)

T/L bushes for F and H flanges only (pages 126 & 127)

1–Flexible tyre (page 111)

EXAMPLE ORDER

Fenaflex coupling F90BH comprising:

1–F90B flange bored 70mm (coded at time of order).

1–F90H flange code 033F0303

1–2517 T/L bush (bore 35mm) code 029M0035

1–F90 Flexible tyre (Natural) code 033F0048

FENAFLEX SPACER COUPLING

Consists of a standard Fenaflex coupling (using B, F or H flanges as desired) together with a spacer flange and a third Taper Lock bush.

EXAMPLE ORDER

Fenaflex spacer assembly F110FF–SM30/140 comprising:

2–F110F flanges – 033H0302 (page 112)

1–F110 flexible tyre – 033H0048 (page 111)

1–SM30 x 140mm spacer flange – 033V3000 (page 112)

1–3020 T/L bush to suit motor shaft – 029P00– (page 126-127)

1–3020 x 60mm T/L bush (dimension 'T' page 126) – 029P0060 (page 127)

1–3030 T/L bush to suit driven shaft – 029Q00– (page 127)

FENAFLEX FLYWHEEL COUPLING

Consists of:

1–Driving (W) flange (page 114)

1–Flexible element (above)

1–Driven flange (page 114)

1–T/L bush to suit driven shaft (F & H driven flanges only)

EXAMPLE ORDER

Fenaflex 114 flywheel coupling comprising

1–116W flange 033G0010

1–Bolt pack 033X0203

1–Standard element 033G0100

1–F100 F flange 033G0302

1–3020 T/L bush 60mm bore 029P0060

Bolts for flywheel fixing can be supplied but are not a stock component.

These semi-elastic flexible couplings are designed for general purpose use and permit quick and easy assembly by means of Taper Lock bush fixing.

Their characteristics are designed for use particularly on machinery driven from standard IEC electric motors.

Fully machined outside diameters allow alignment by simple straight edge methods.

Shaft connection is "fail safe" due to interacting dog design.

SELECTION

(a) Service Factor

Determine appropriate Service Factor from table below

(b) Design Power

Multiply running power of driven machinery by the service factor. This gives the design power which is used as a basis for coupling selection.

(c) Coupling Size

Refer to Power Ratings table below and read across from the appropriate speed until a power equal to or greater than the design power is found. The size of coupling is given at the head of that column.

(d) Bore Size

From Dimensions table on page 117 check that the required bores can be accommodated.

EXAMPLE

A shaft coupling is required to transmit 70kW between a 1200 rev/min diesel engine and a hoist running over 16hrs/day. Engine shaft is 70mm and the hoist shaft is 75mm.

(a) Service Factor

The appropriate service factor is 2.5.

(b) Design Power

Design power $70 \times 2.5 = 175\text{kW}$.

(c) Coupling Size

Reading across from 1200 rev/min in the speed column of Power Ratings table below, 251kW is the first power to exceed the required 175kW (design power). The size of the coupling at the head of this column is 230.

(d) Bore Size

The Dimensions table (page 117) shows that both shaft diameters are within the bore range available.

SERVICE FACTORS

SPECIAL CASES For applications where substantial shock, vibration and torque fluctuation occur, and for reciprocating machines e.g. internal combustion engines, piston type pumps and compressors, refer to your local Authorised Distributor. with full machine details for torsional analysis.	Type of Driving Unit					
	Electric Motors Steam Turbines			Internal Combustion Engines Steam Engines Water Turbines		
	Hours per day duty			Hours per day duty		
Driven Machine Class	8 and under	over 8 to 16 inclusive	over 16	8 and under	over 8 to 16 inclusive	over 16
UNIFORM Agitators, Brewing machinery, Centrifugal blowers, Centrifugal compressors†, Conveyors, Centrifugal fans and pumps, Generators, Sewage disposal equipment.	1.00	1.12	1.25	1.25	1.40	1.60
MODERATE SHOCK* Clay working machinery, Crane hoists, Laundry machinery, Wood working machinery, Machine tools, Rotary mills, Paper mill machinery, Textile machinery, Non-uniformly loaded centrifugal pumps.	1.60	1.80	2.00	2.00	2.24	2.50
HEAVY SHOCK* Reciprocating conveyors, Crushers, Shakers, Metal mills, Rubber machinery (Banbury mixers and mills), Reciprocating compressors, Welding sets.	2.50	2.80	3.12	3.12	3.55	4.00

* It is recommended that keys (with top clearance if in Taper Lock bushes) are fitted for applications where load fluctuation is expected.

† For Centrifugal Compressors multiply Service Factor by an additional 1, 15.

Note: For details of HRC couplings suitable for application to drives involving SAE engine flywheels, consult your local Authorised Distributor.

Type B flanges can be supplied finished bored to H7 tolerance with keyway, if required.

Hub material: GG25 grey cast iron.

Fenner Jaw Couplings offer a range of hub and element variants to meet the demand for low cost, general purpose and spacer type flexible couplings. They cater for incidental misalignment, absorb shock loads and damp out small amplitude vibrations.

All dimensions in millimetres unless otherwise stated

Hub material is high grade cast iron. Spacer material is aluminium

DBSE = distance between shaft ends

† Mass of complete SX or QF type with pilot bore hubs

* Bored or bored and keywayed hubs can be supplied.

ASSEMBLY VARIANTS - SEE DIAGRAM TO RIGHT

- SX** Simple coupling of two close-coupled shafts using 2 x SX hubs + a spider shaped element. The element petals are connected by an inner ring to maintain location between the 'jaws' on the hubs. Urethane and Hytre[®] spider elements are available to enhance the coupling power rating. (see page 119).
- QF** On sizes 095 and above, the SX hubs are drilled/tapped for fixing a pressed steel 'ring' or sleeve. The ring retains a QF type nitrile rubber element on which the petals are joined by an outer band. Unscrewing and withdrawing the ring allows the element to be removed for replacement without disturbing the hubs. The retaining ring and element are supplied together as a 'ring kit'.
- QFS** Used when the machine shafts to be coupled are set apart by a DBSE (distance between shaft ends) of 100 or 140mm. This arrangement is common with centrifugal pump applications. A QF coupling is used with a light alloy spacer, which is supplied complete with a second ring kit, to create a spacer coupling which is easily disassembled by removing the two elements.

JAW COUPLING ELEMENTS

Code	Type	Temperature Range (°C)	Max Misalignment		Power Factor
			Ang ^o	Par. (mm)	
968-9000	Nitrile (Spider) ^(Black)	-40 to 100	1	0.38	1
968-9900	Nitrile (QF ring kit) ^(Black)	-40 to 100	1	0.38	1
968-9500	Urethane ^(Blue)	-35 to 70	1	0.38	1,5
968-9400	Hytrel ^(White)	-50 to 120	1/2	0.38	3*

4th digit = Alpha character for coupling size

Note: Sizes 90 and 95 SX couplings use the same spider element.

*Power factor = 2 when used with CEC hubs

SELECTION

- Find Service Factor for application from table right.
- Multiply normal running power by Service Factor (and Temperature Factor from table above for CEC hubs) to give design power.
- Select a standard nitrile element coupling size from Power Ratings table below by reading across from the appropriate speed until a power equal to or greater than the design power is found. Coupling size is at the head of the column.
- For alternative elements divide the design power from step (b) by the Element Power Factor in table above and repeat step (c) with the new design power.
- For speeds other than those listed use the nominal torque ratings from the Power Ratings table below.

$$\text{Required Torque (Nm)} = \frac{\text{Design power (kW)} \times 9550}{\text{rev/min}}$$

- Check from the hub Dimensions tables that bore capacity is adequate for the coupled shafts.

Note: Orders for complete couplings should include hubs, elements, ring kits and spacer kits separately.

SERVICE FACTORS

Driven Load	Prime Mover

SPACERS AND QF RETAINING RINGS – CODES

All codes first 4 digits: 968-

4th digit: Alpha character for coupling size

5/6th digits: Spacer kit = 33; Retaining ring kit = 99

7/8th digits: Retaining ring kit = 00; Spacer kit 100mm = 10; Spacer kit 140mm = 14

Rigid Couplings

Taper Lock Rigid Couplings provide a convenient method of rigidly connecting ends of shafts. Taper Lock bushes permit easier and quicker fixing to the shafts with the firmness of a shrunk-on-fit. These

couplings have a male and female flange fully machined. The male flange can have the bush fitted from the Hub side **H** or from the Flange side **F**, the female flange always has the bush fitting **F**. This gives

two possible coupling assemblies **HF** and **FF**. When connecting horizontal shafts, the most convenient assembly should be chosen. **When connecting vertical shafts use assembly FF only.**

SELECTION

For all applications using standard mild steel shafting it is sufficiently accurate to select the coupling by consideration of bore size alone.

If transmitted torque is known, this should be checked against the allowable torque for the appropriate Taper Lock bush size/bore shown on page 128.

For all other applications consult your local Authorised Distributor.

Rotational speed should be limited to a maximum rim speed of 33 m/sec.

SHAFT ALIGNMENT

Appropriate alignment of the coupled shafts (or driven shaft to flywheel) is a fundamental requirement for any coupling installation.

The three basic modes of shaft misalignment are shown right.

Composite i.e. more than one mode, misalignment is available for some couplings (detailed elsewhere in this Manual).

Details of the degrees of misalignment that can be accommodated by different types and sizes of coupling are given throughout this manual.

With some couplings, axial shaft orientation (DBSE) is not critical, whereupon coupling component orientation (given as an 'assembled length' or 'distance between faces') becomes crucial.

It should be remembered that misalignment can cause extra loading on coupled shaft support bearings and can reduce the operational life of some couplings. Best practical alignment is therefore desirable.

Taper Lock Rigid Couplings cannot accommodate misalignment.

Laser alignment equipment can be supplied.

OTHER CRITERIA

Fenaflex – tyre gap and seating. Tyre/element clamping bolt torque.

HRC – do not use to couple resiliently mounted machinery.

All Elastomeric Couplings – consider ambient conditions (FRAS or other alternative element material required?)

All Taper Lock Couplings – remember bush grips shaft first and draws hub on to taper. This may affect axial alignment.

All applications – ensure shaft diameter tolerances are correct.

Note: Fenaflex tyres and flywheel elements are accompanied by detailed installation data.

TAPER LOCK

Most of the Fenaflex and HRC couplings, and all Rigid couplings featured in this section use Taper Lock shaft fixing.

For detailed instructions on the fitting and dismantling of Taper Lock products see Shaft Fixings page 129.

Note: When fitting Taper Lock coupling flanges it should be noted that the bush grips the shaft initially and draws the flange up the tapered surface.

This may have a small effect on the final axial positioning of flanges on machine shafts, and the resultant distance between coupling flanges, where this is important to the fit and function of flexible coupling elements.

ANGULAR MISALIGNMENT – shafts are at an angle to one another

PARALLEL MISALIGNMENT – shafts are in line angularly and parallel to each other, but are off-set radially.

AXIAL MISALIGNMENT – refers to errors in the axial spacing of coupling hubs/flanges, but also includes applicational 'end float' where shafts move axially increasing or decreasing the distance between shaft ends.

Fenner®

SHAFT FIXINGS

The extended range of Fenner shaft fixing devices offers the ideal means for every application. As well as the industrial standard Taper Lock bush, and associated hubs/adaptors, the Fenner keyless fixing device range includes FenLock fixings in most formats and the rapid fit Trantorque GT.

Shaft Fixings Design Data Required

**WELD-ON-HUBS**

Fenner Taper Lock Weld-on Hubs are made of steel, grade 070M20, drilled, tapped and taper bored to receive standard Taper Lock bushes.

The shouldered outer diameter provides a convenient means of welding hubs into fan rotors, steel pulleys, plate sprockets, impellers, agitators and many other devices which must be firmly fastened to the shaft.

**WELDING INSTRUCTIONS**

Fenner Taper Lock Weld-on Hubs are made of steel, are machined to accept Taper Lock bushes for shaft fixing, and have a precision machined shoulder against which flanges or webs can be located.

It is recommended that a continuous 45° mitre weld be used, working on the larger hub diameter section only. To ensure accuracy in the welded assembly it is essential to apply only sufficient weld to achieve sufficient strength.

Excess weld should not be necessary for normal use and, due to greater heat input, gives a higher risk of distortion.

The table below shows recommended continuous fillet weld requirements for each hub size.

Hub No	Leg Length mm
WH12	4
WH16	4
WH20	5
WH25	5
WH30	6
WH35	6
WH40	8
WH45	8
WH50	10

For electric arc welding, low hydrogen electrodes are recommended

Dimensions in millimetres.

Keyways are British Standard Metric BS 4235: Part 1: 1972 DIN 6885 and conform to ISO recommendations with the exception of those marked* which are shallower.

Where a key is to be used it should be parallel and side fitting, with top clearance. Depth of keyway is measured at the CENTRE.

Bold italic type indicates bushes made of steel or ductile iron.

Dimensions in inches.

All Keyways are parallel and to British Standard 46: Part 1: 1958, with the exception of those marked* which are shallower.

Where a key is to be used it should be side fitting, with top clearance. Depth of keyway is measured at the CENTRE.

Bold italic type indicates bushes made of steel or ductile iron.

MINIMUM DIAMETERS OF TAPER BORED HUBS

The following table shows the recommended minimum diameter in mm for bespoke component hubs that are to be drilled, tapped and taper bored for use with Taper Lock bushes. The table differentiates between grey iron and ductile materials of various minimum tensile strength grades (in N/mm² or MN/m² units, which are numerically equal).

All standard Fenner Taper Lock products are tested to ensure that they are capable of safely containing the radial and circumferential hub stresses generated by the wedging mechanism which makes Taper Lock the equivalent of a shrink-on fit. For Taper Lock hub machining details, consult your local Authorised Distributor.

Taper Lock® Bush	Minimum Hub Diameters (mm) for Various Materials			
	Tensile Strength N/mm ²			
	Cast Iron 180	Cast Iron 250	Steel / Ductile Iron 420	Steel 600

5050	233	223	219	213

AVERAGE SLIP TORQUES FOR TAPER LOCK FIXING (WITHOUT KEY)

The following table shows empirically derived average slip torque values in Nm for each basic Taper Lock bush size with a variety of common metric bore diameters. The values assume that the assembly uses a Fenner Taper Lock bush fitted, in accordance with the instructions supplied with every bush, to a hub prepared to the Fenner specification. Slip will tend to occur at the bush/shaft interface, at the prescribed torque, unless a key is fitted. With a key, the slip tendency transfers to the bush/hub interface at a greater torque value related to the ratio of bush outer dia. to bore dia.. Consult your local Authorised Distributor for specific values.

Taper Lock bushes should only be used without a key fitted on smooth, uniformly loaded drives with service factors of 1.0 or less.

Formula to calculate the slip torque if a key is used: $\frac{\text{Large end diameter}^*}{\text{Bush bore}} \times \text{Average slip torque value Nm (below)}$

* From the table on page 129

Bush	Bore (mm)	Average Slip Torque (Nm)	Bush	Bore (mm)	Average Slip Torque (Nm)	
1008	12	29	3020	38	520	
	19	51		3030	48	730

	50	420			110	6300
2517	24	220	5040		125*	6625
	38	380		5050	75	3950
	42	430			100	5650
	48	510			125	7370
	55	600				
	60	670				

Large bores marked* are only available in bush sizes marked*

Taper Lock bushes work effectively on shaft diameters with h9 tolerance. If in doubt please consult your local Authorised Distributor..

Taper Lock Installation Instructions

TO INSTALL

1. After ensuring that the mating tapered surfaces, bore and shaft are completely clean and free from oil or dirt, insert bush in hub so that holes line up.
2. Sparingly oil thread and point of grub screws, or thread and under head of cap screws. Place screws loosely in holes threaded in hub, shown thus © in diagram.
3. If a key is to be fitted place it in the shaft keyway before fitting the bush. It is essential that it is a parallel key and side fitting only and has TOP CLEARANCE.
4. Clean shaft and fit hub to shaft as one unit and locate in position desired, remembering that bush will nip the shaft first and then hub will be slightly drawn on to the brush.
5. Using a hexagon wrench tighten screws gradually and alternately to torque shown in table below.
6. Hammer against large-end of bush, using a block or sleeve to prevent damage. (This will ensure that the bush is seated squarely in the bore.) Screws will now turn a little more. Repeat this alternate hammering and screw tightening once or twice to achieve maximum grip on the shaft.
7. After drive has been running under load for a short time stop and check tightness of screws.
8. Fill empty holes with grease to exclude dirt.

INSERT BUSH

INSERT SCREWS AND LOCATE ON SHAFT

TIGHTEN SCREWS FINGER TIGHT

TIGHTEN SCREWS ALTERNATELY

REMOVAL

TO REMOVE

1. Slacken all screws by several turns, remove one or two according to number of removal holes shown thus ● in diagram. Insert screws into removal holes after oiling thread and under head of cap screws.
2. Tighten screws alternately until bush is loosened in hub and assembly is free on the shaft.
3. Remove assembly from shaft.

Trantorque GT is a single nut locking bush with interlocking components for positive fixing and release. It is a high torque keyless bushing system, ideal for critical timing applications.

Trantorque GT is easy to install and requires no special machining, no keyways. It can be easily adjusted and removed, and allows infinite positioning that is essential for precise timing and synchronisation.

With fewer component parts, Trantorque GT offers significant installation advantages, reducing downtime and operating costs. The single GT nut can be torqued-up in seconds...

ADVANTAGES TRANTORQUE GT

■ Eliminate Keys, Keyways, Setscrews

Eliminate costly matching with inexpensive Trantorque GT mounts. They grip like a shrink-fit on shaft and bore, and resist shocks and torque reversals better than keyways. Single-nut design self-centres accurately, locks or unlocks with the twist of a wrench.

■ Infinite, Precise Radial Adjustment

The positive lock and release action permits exact initial positioning with easy readjustment at a later date. This is not possible with fixed keyed connections.

■ Use Smaller Shafts

Eliminate the weak spot in shafts and hubs caused by machining keyways. This, plus the rigidising effect, permits smaller and less expensive shafts and bearings with equal strength and stiffness.

■ Retrofit and Repair

Can be used directly over empty keyways to repair a worn or damaged connection. Both metric and Imperial units are available making it easy to quickly return machinery to service.

■ Mount Hubless Devices

Trantorque GT mounts are unique in their ability to mount thin hubless devices. They need not be completely within the bore. This permits mounting plate sprockets, hubless gears, disc brakes, etc. – often at substantial savings to the user or OEM.

■ Speed Prototype Development

Easy installation, adjustment and removal permit great freedom and flexibility in new-product development. Trantorque mounts can be removed and reinstalled many times...a major advantage on prototype or final product.

EFFECT OF TEMPERATURE

TRANTORQUE GT units are not affected by temperature within wide limits (-34°C to 204°C) when the shaft and hub are made of steel. TRANTORQUE GT units are all steel. If the shaft and/or hub are made of different materials e.g. aluminum, straightforward engineering compensation should be made for the difference in expansion coefficients.

In normal environments, where the seasonal ambient variation is less than 35°C, no compensation will generally be required, even with dissimilar metals.

AXIAL MOVEMENT

When progressing from hand-tight to full installation torque there is a small axial movement of the outer element (and fixed component), in the same direction as the nut is tightened.

The inner element of the bushing remains secure to the shaft during nut tightening.

RUNOUT TOLERANCE

All Trantorque GT units guarantee hub bore concentricity within 0.025mm (0.001")

BEARINGS AND SYNTHETIC HUB MATERIALS

Trantorque GT units are not recommended for use with components having hubs made of synthetic (non-metallic) materials. Such materials suffer creep under radial loads and will suffer loosening over time.

Mounting bearings with Trantorque GT is not recommended.

The expansion forces reduce the radial internal clearance within the bearing and can cause premature failure.

Tolerances on shaft and bore, miniature Series ± .038 mm, (.0015"). Standard and Larger Series ± .076 mm, (0.003"). Other sizes, types and materials are available to order. Consult your local Authorised Distributor.

SELECTION

To select the TRANTORQUE GT suitable for your application simply choose the bush with the appropriate ('d') to suit the shaft diameter and determine that the outside diameter ('D') and transmissible torque rating will be adequate.

Note: The nominal transmitted torque in Nm should be multiplied by a service factor before comparing with the tabulated maximum transmissible torque.

Service factors range from 1.0 for electric motor driven, smooth machines, to 2.25 for heavy shock machinery driven by i/c engines. If in doubt consult your local Authorised Distributor.

Use the following formula to convert power (kW) to torque (Nm)

$$\text{Torque (Nm)} = \frac{\text{kW} \times 9550}{\text{rev/min}}$$

INSTALLATION

- Clean off the shaft and bore with a clean rag dampened with a commercial solvent so that the bore and the shaft are clean and completely free of oil.
- Fit the TRANTORQUE GT unit onto the shaft: the shaft must extend through the full length of the TRANTORQUE GT (dimension L₁).
- Fit the hub over the TRANTORQUE GT unit so that the expanding section of the unit (dimension L₂) is approximately in the centre of the hub. If the hub is longer than the L₂ dimension, make sure that the flats of the nut(s) (dimensions B) are outside of the hub to permit spanners to be applied to the nut(s).
- Tighten the outboard nut lightly by hand. Position the unit and the hub in the desired location. Now tighten the outboard nut to the torque indicated in the charts. The hub is now locked to the shaft. With Trantorque GT the inboard nut is used to restrain the unit and the shaft during tightening.

SHAFT DIAMETER & HUB BORE TOLERANCES & FINISH

Mini Series	Nominal ± 0.04mm (0.0015")
Standard/large series	Nominal ± 0.08mm (0.003")
Surface Finish	1.6 - 3.2 µm

MOUNTING OF HUBLESS MACHINE ELEMENTS

Hubbleless machine elements such as plate gears, plate disc brakes, plate cams and plate sprockets, can be successfully locked to the shaft by means of the TRANTORQUE GT, but some account should be taken of the increased hub pressure on these applications.

FenLock cone clamping elements are precision made in the finest steel materials to provide a wide, versatile range of keyless shaft/hub fixing assemblies.

They offer

- Simple installation/disassembly
- Resistance to alternating torques
- Increased shaft strength
- High torque transmission capacity
- No backlash
- Axial and angular adjustment capability
- No fretting corrosion
- Simple selection

THE FENLOCK PRODUCT RANGE

FLK 200

Medium/high torque
Non self centering
Available for shafts 20-900 mm dia.
Max allowable surface finish Rt max 16µm
Tolerances h11 shaft - H11 hub
No axial movement

FLK 450

Very high torque
Self centering
Available for shafts 45-400 mm dia.
Max allowable surface finish Rt max 16µm
Tolerances h8 shaft - H8 hub.

FLK 132

Less screws - quicker installation
Self centering Medium/high torque
Max allowable surface finish Rt max 16µm
Slight axial movement hub/shaft
Available for shafts 20-200 mm dia
Tolerances h8 shaft - H8 hub.

FLK 133

As FLK 132 with larger dia. location collar
Less screws - quicker installation
Medium/high torque Self centering
No axial movement hub/shaft
Available for shafts 20-200 mm dia
Max allowable surface finish Rt max 16µm
Tolerances h8 shaft - H8hub.

FLK 130

High torque
Self centering
Max allowable surface finish Rt max 16µm
Slight axial movement hub/shaft
Available for shafts 20-180 mm dia
Tolerances h8 shaft - H8 hub.

FLK 131

As FLK 130 with larger dia. location collar
High torque
Self centering
No axial movement hub/shaft
Available for shafts 20-180 mm dia
Max allowable surface finish Rt max 16µm
Tolerances h8 shaft - H8 hub.

FLK 300

Medium/low torque
Non self centering
Max allowable surface finish Rt max 6µm
Available for shafts 6-300 mm dia
(larger sizes to order)
Tolerances ≥ 40mm dia, h6 shaft - H7 hub
≤ 42mm dia h8 shaft - H8 hub

FLK 250L

Similar to FLK 300 with integral single nut fixing
Medium/low torque Self centering
Max allowable surface finish Rt max 16µm
Slight axial movement hub/shaft
Available for shafts 14-60 mm dia
Tolerances h8 shaft - H8 hub.

FLK 110

Few screws - quicker installation
Medium/high torque Self centering
Max allowable surface finish Rt max 16µm
Available for shafts 6-130 mm dia
Tolerances h8 shaft - H8 hub.

FLK 603

'Shrink disc' device for hub clamping
Quick installation
Medium/high torque Self centering
Available for hubs 14-280 mm dia
(larger sizes to order)
Max allowable surface finish Rt max 16µm
Tolerances h8 shaft.

FENLOCK SELECTION

1. Determine the maximum torque (Nm) to be transmitted, including fluctuations and shock loads, and any axial forces (kN) to be withstood.
2. Use the features table above to help determine the type of FenLock device to use.
3. Use the tabulated data on the following pages to establish torque (Mt) and axial load capacity (F) of the chosen unit on the shaft size being used, and that they exceed applicational requirements.

Note: Maximum torque and axial force values are mutually exclusive. For combined torque and axial force applications, consult your local Authorised Distributor.

4. Check dimensional suitability, self centering capability and ease of installation/disassembly.
5. For hub strength calculations or more detailed selection advice - consult your local Authorised Distributor.

INSTALLATION

1. Ensure cleanliness of hub and shaft contact surfaces
2. Screw threads and conical surfaces should be lightly oiled.
3. Tighten fixing screws gradually, in diagonal sequence, up to torque Ms (Nm)
4. For more detailed information - consult your local Authorised Distributor.

FenLock™ Cone Clamping Elements

To Calculate the Minimum Hub Diameter (Dm).

FenLock cone clamping elements create a surface pressure **Pn** between the clamping outer ring and hub bore when fitted. Shaft values are higher than the hub stresses but generally the hub stress level is the critical factor as it must be below the yield stress of the material.

The minimum hub diameter **Dm** is calculated using the following formula

$$Dm \geq (D \cdot K)$$

where

Dm = Minimum hub diameter

D = Outside diameter of clamping element

K = Coefficient K derived from the table below

Use **Pn** from product tables on pages 134 - 138

factor C (see below)

Example

Based on securing a cast iron 50mm wide pulley to a steel shaft using a FenLock 200 80 x 120.

Pulley Material = GG25

C = 0.8 as assembly is as per type 2

Pn = 120 N/mm² as page 134

K = 1.81

$$Dm \geq (D \cdot K)$$

$$Dm \geq (120 \times 1.81)$$

$$Dm \geq 217.2\text{mm}$$

Therefore, the minimum hub diameter that can be used is 217.2mm.

FACTOR C

COEFFICIENT K

Pressure generated on the hub Pn N/mm²			Yield point N/mm²

Fenner® QD SERIES INVERTERS

Fenner QD (Quick Drive) Series inverters are ideal for both simple and sophisticated applications, due to their broad range of functions, easy configuration, simple installation and ultimate performance.

NEW

- **Fenner QD:IP55 & IP66;** ultimate protection for the harshest environment. Available in QD:E and QD:CT PLUS
- **Fenner QD:E;** easy to use general purpose drive with V/F control
- **Fenner QD:VT;** variable torque control optimised drive to minimise energy ideal for HVAC applications
- **Fenner QD:CT PLUS;** constant torque vector control delivers 200% torque down to 0.0Hz without feedback

**Inverters
Design Data Required**

- Electrical Supply Voltage
- Constant / Variable Torque Application
- IP Rating Required
- Driven Machine
- Speed Range of Machine
- Cable Length to Motor
- Control Options Required
- Ambient Temperature
- Communication Options Required

Fenner QD Series Inverters

Improved Control Performance

- Third Generation Vector technology for ultimate motor control
- Unique open-loop performance allows this drive to be used in applications previously requiring a feedback signal
- 200% torque even at very low speeds with sensorless vector control
- High starting capacity available – 150% overload for 60 seconds and 175% for 2 seconds
- Ultra-quiet performance running at 32kHz switching frequency minimising motor noise

Quick Installation and Set-up

- Quick set-up – 14 standard parameters
- Various control options available. Local control or remote keypad along with communication networks.
- Auto-tune facility for fast set-up to achieve optimum performance (on CT/VT units)
- Fully Enclosed IP55/NEMA 12 with speed control FWD/REV selector and lockable isolator

Q-PORT

- Remote keypad and display for panel mounted control

Compliant with Industrial Standards

- Internal RFI filter for compliance with latest EMC Standards (EN 61800-3)
- Compliant with RoHS directives
- CE Europe and UL/CUL product accreditation

Q-STICK

- Upload/Download parameters on the QD:E drive for quick and accurate repeat programming
- The Q-STICK incorporates Infra-red communication to allow programming with a PDA or smart phone

CONVEYING

Obtaining the optimum speed of product transfer is a primary requirement of all conveyor systems. Fenner QD inverters and Fenner FM:P motors are suitable for horizontal, vertical or inclined conveyors, to give accurate speed control and a high starting torque to ensure reliable and efficient transportation of products.

BUILDING MANAGEMENT

Comfort and efficiency are key requirements for the environment within today's modern buildings. Easy to install and reliable Fenner QD inverters and FM:P motors ensure that the large number of motors driving fans and pumps for heating, ventilation and air conditioning are running at their optimum level, saving both energy and protecting the environment.

MIXING

For fixed speed or variable speed mixing applications, Fenner QD:CT PLUS Inverters and FM:P motors provide, high starting torque and application specific programmes ensuring mixing process times are optimised to improve productivity and increase efficiency.

PULP AND PAPER

From complex multi-function process control to single drive applications Fenner QD inverters and FM:P motors can reliably improve preparation and manufacturing processes from the wood yard or recycling yard to the paper machine and the paper converting process. Continuously improving uptime, quality and efficiency.

PLASTICS/MOULDING

Long running hours, a harsh working environment and precise speed control are just some of the tasks Fenner QD inverters and FM:P motors are designed to deliver. From a single conveyor application to fully integrated extrusion/moulding, the Fenner motors and drives package delivers a new level of control, reliability, flexibility and efficiency.

PUMPING

Pump systems need to be both reliable and efficient, ensuring that the correct volume of product is transported accurately and dependably. Fenner QD inverters and FM:P motors are designed to provide efficient and reliable service and can even be integrated into building management systems.

BOTTLING

Machinery which requires fast and accurate positioning in a harsh working environment, Fenner QD inverters are designed to work within panels or as stand-alone units allowing flexibility for high speed process applications.

Ordering Instructions

All Fenner QD Inverters are identified with a unique code number. This consists of an eight digit code depending on the enclosure, power, supply voltage and range.

Construction of the coding system is explained below.

FIRST THREE DIGITS:

Series and enclosure

Code	Range	Enclosure
572	QD:E / CT PLUS / VT	IP20
575	QD:E / CT PLUS	IP55
576	QD:E	IP66

FOURTH DIGIT:

Inverter type

Code	Series
B	QD-E (Basic Inverter)
V	QD-CT PLUS (VECTOR control)
H	QD-VT (HVAC drive)
X	QD Options (All Models)

FIFTH DIGIT:

Supply voltage code

Code	Voltage
2	220-240V 1~ supply
3	220-240V 3~ supply
4	380-440V 3~ supply

SIXTH, SEVENTH & EIGHTH DIGITS:

Rated power code

Code	Output Power (kW)
0P4	0.37
0P7	0.75
1P5	1.50
2P2	2.20
3P0	3.00
4P0	4.00
5P5	5.50
7P5	7.50
011	11.0
015	15.0
018	18.5
022	22.0
030	30.0
037	37.0
045	45.0
055	55.0
075	75.0
090	90.0
110	110.0
132	132.0
160	160.0

NINTH DIGIT:

Special features

Code	Output Power
N	Non-Switched IP55 Non-standard option
E	Enlarged Frame Size Non-standard option

Fenner QD:E

FENNER QD:IP55 & IP66 MOUNTING CLEARANCES

The IP55 / NEMA 12 Fenner drives can be installed side-by-side with their heatsink flanges touching. This allows adequate ventilation space between drives.

If the IP55 Fenner drive is to be installed above another drive or any other heat-producing device, the minimum vertical spacing is 150mm (5.9 inches)

Note: The IP55/NEMA 12 drive is intended for INDOOR USE ONLY

In the table below, Dimension Z assumes that the drives are mounted side-by-side with no clearance.

Typical drive heat losses are 3% of operating load conditions.

The figures below are guidelines only and the maximum operating ambient temperature of the drive **MUST NOT** be exceeded. If in doubt, please contact your local Fenner Authorised Distributor.

Sizes 1 & 2 are designed to be mounted onto DIN rail.

FENNER QD:E MOUNTING CLEARANCES

Frame Size	X mm	Y mm	Z mm	Recommended Airflow CFM (ft ³ /min)
1	50	50	33	11
2	75	50	46	11
3	100	50	52	26

GLAND HOLE SIZES QD:IP55

Any Metal conduit used **MUST** be earth bonded by means of a suitable earthing washer or gland adaptor.

PLEASE NOTE:

Where wires are required in the IP66 drive they must be made by the installer in line with the recommended hole sizes and gland sizes given for the IP55 unit (see table).

Lock Off:

The main power isolator switch can be locked in the 'Off' position using a 20mm standard shackle padlock (not supplied).

Gland Hole Sizes IP55

Frame Size	Input (A) & Output (B)	Centre Knockout (C)	Terminal Cover Knockout (D)
1	Ø 22mm	Ø 22mm	Ø 17mm
2	Ø 25mm	Ø 22mm	Ø 17mm
3	Ø 25mm	Ø 22mm	Ø 17mm

Recommended Gland Type IP55

SkinTop UL approved (UL94-V0) Type 12/IP55 non-metallic cable gland or non-rigid conduit

Frame Size	Input (A) & Output (B)	Centre Knockout (C)	Terminal Cover Knockout (D)
1	PG13.5 / M20	PG13.5 / M20	PG9 / M16
2	PG16 / M25	PG13.5 / M20	PG9 / M16
3	PG16 / M25	PG13.5 / M20	PG9 / M16

FENNER QD:VT & QD:CT PLUS MOUNTING CLEARANCES

The Fenner QD:VT and QD:CT PLUS drives can be installed side-by-side with their heatsink flanges touching. This gives adequate ventilation space between them. If the drive is to be installed above another drive or any other heat producing device, the minimum vertical spacing is 150mm. The enclosure should either be force ventilated or large enough to allow natural cooling.

For drives mounted in free ventilated enclosures or force ventilated enclosures, the following minimum sizes and airflow requirements are recommended:

QD:VT & QD:CT PLUS Mounting Clearances

Frame Size	Max. Power Rating kW	Free-Vented Unit			Force-Vented Unit					
		L	W	D	G	L	W	D	G	Airflow m ³ /h
1	1.5	400	300	150	75	275	150	150	50	> 15

FENNER QD:E CONNECTION

Terminal	Torque Settings
Control	0.5 Nm
Power	1 Nm

IP20 DRIVES

Size 1 Connections

Size 2 & 3 Connections

Drive and Motor Connections

For 1 phase supply power should be connected to L1/L, L2/N.

For 3 phase supplies power should be connected to L1, L2, L3. Phase sequence is not important.

The motor should be connected to U, V, W.

For drives that have a dynamic brake transistor an optional external braking resistor will need be connected to +DC and BR. The brake resistor circuit should be protected by a suitable thermal protection circuit.

+DC and -DC connections can be used for DC Bus paralleling applications.

The -DC, +DC and BR connections are blanked off by plastic tabs when sent from the factory. The plastic tabs can be removed if/when required.

QD:IP55 / QD:IP66 DRIVES

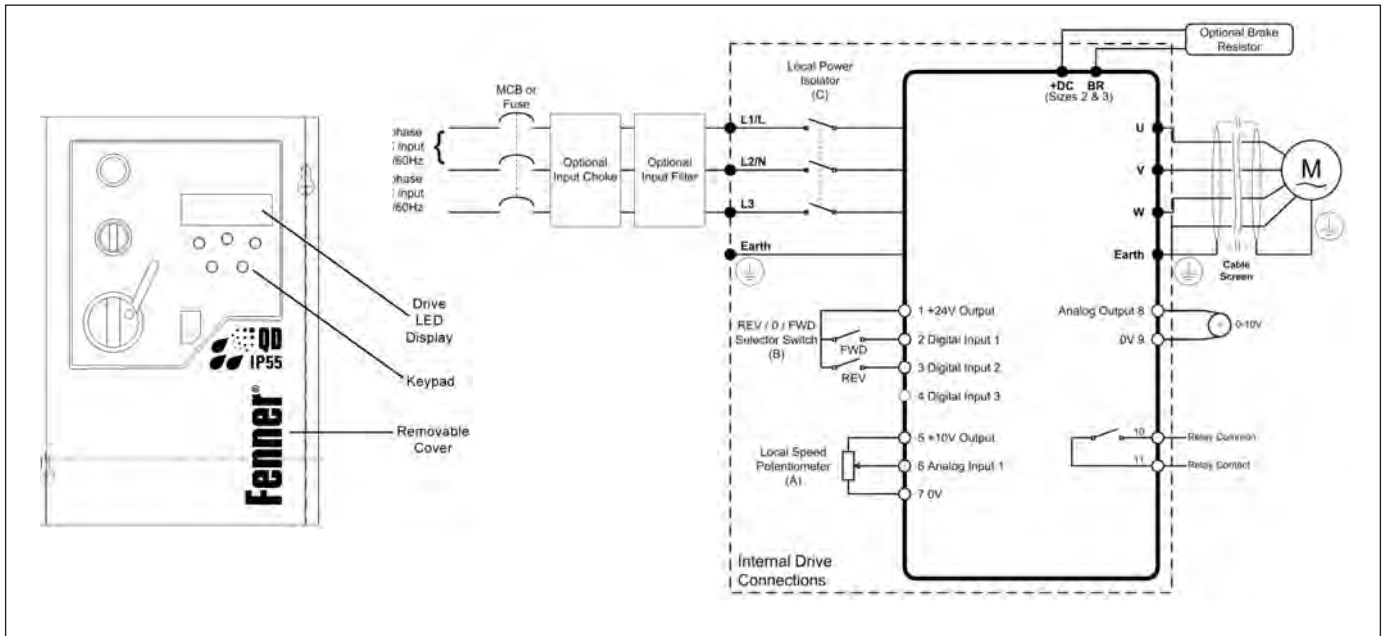

Size 1 Connections

Size 2 & 3 Connections

Terminal	Torque Settings
Control	0.5 Nm
Power	1 Nm

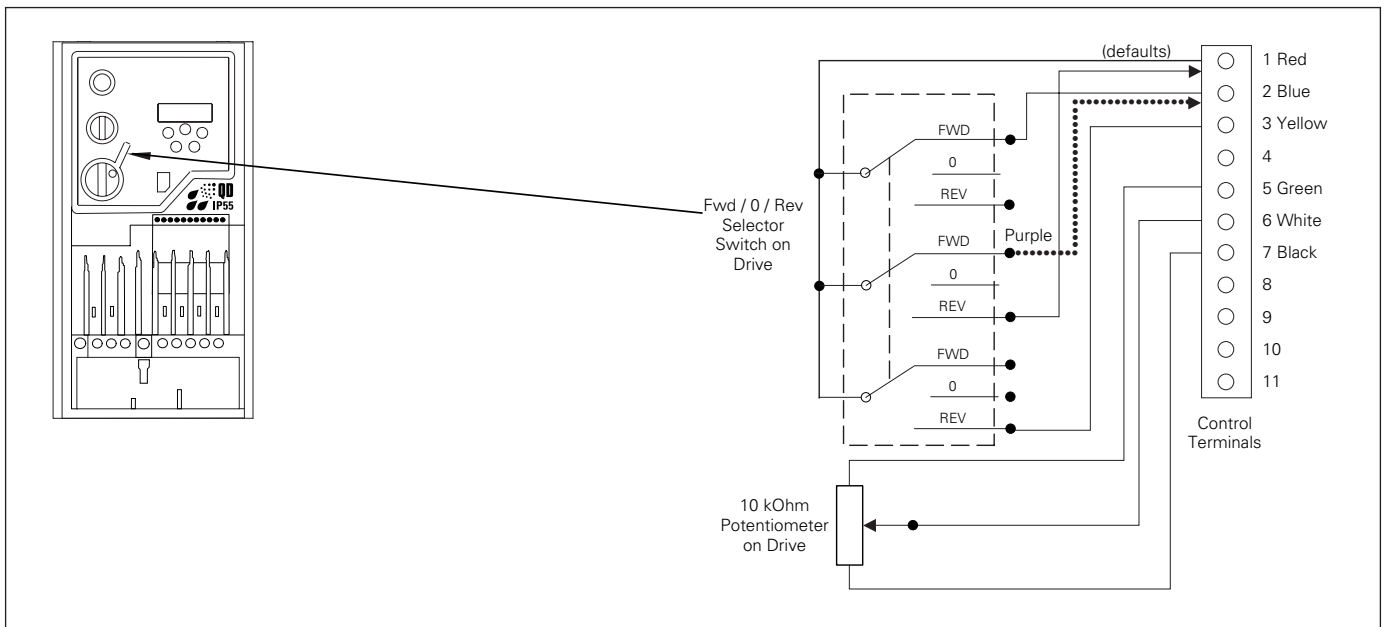

Note: Further information on all of the above can be found in the Advanced User Guide.

FENNER QD:E IP55 & IP66 CONNECTION DIAGRAM

Note: For Safety reasons the REV (Run reverse) setting is disabled by default. To enable the REV (run reverse) setting change parameter P-15 to 5.

FENNER QD:CT PLUS IP55 CONNECTION DIAGRAM

Note: Purple wire can be moved from terminal 1 (default) to terminal 2 to give greater functionality.

FENNER QD:VT & QD:CT PLUS CONNECTION

Drive and Motor Connection (IP20)

Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor.

This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection.

STAR always gives the higher of the two voltage ratings.

Typical ratings are: 400 / 230 (Δ/Δ)
 690 / 400 (Δ/Δ)

RS485 Interface Configuration

CONTROL TERMINAL CONNECTIONS

Default Connections

Control Terminal	Signal
1	+24V User Output
2	Digital Input 1
3	Digital Input 2
4	Digital Input 3 / Analog Input 2
5	+10V User Output
6	Analog Input 1 / Digital Input 4
7	0V
8	Analog Output / Digital Output
9	0V
10	Relay Common
11	Relay NO Contact

Control Terminal 1	+24V User Output
Current Limit	100mA

Control Terminal 2 & 3	Digital Inputs 1 & 2
Positive Logic	
Digital Voltage Range	8 to 30V
Sample Time	8 ms

Control Terminal 4	Digital Input 3 or Analog Input 2
Positive Logic	Digital Voltage Range 8 to 30V
Sample Time	8 ms
Analog Input Formats	As per Parameter P-47 Voltage: 0-10V Current: 4-20mA, 0-20mA, 20-4mA
Resolution	12-bit (0.025%)

Control Terminal 5	+10V Output
Current Limit	10mA
Minimum Resistance	1kΩ

Control Terminal 6	Analog Input 1 or Digital Input 4
Analog Input Formats	As per Parameter P-16 Voltage: 0-10V Current: 4-20mA, 0-20mA, 20-4mA
Resolution	12-bit (0.025%)
Positive Logic	-
Digital Voltage Range	8 to 30V
Sample Time	8 ms

Control Terminal 7 & 9	0V
------------------------	----

Control Terminal 8	Analog Output or Digital Output
Analog Voltage Range	0 to 10V
Digital Voltage Range	0 to 24V
Max Output Current	20mA

Control Terminal 10 & 11	User Relay Contacts
Voltage Rating	250 Vac / 30Vdc
Current Rating	6A / 5A
Contact Isolation	2.5kV
Operation of Relay	OPEN: No AC Supply OR Function of P-18 disabled CLOSED: AC Supply present & Function of P-18 enabled

CONTROL TERMINAL CONNECTIONS

The control terminals are defined as follows:

Control Terminal	Signal
1	+24V, 100mA user output.
2	Digital input 1, positive logic. "Logic 1" when Vin > 8V DC
3	Digital input 2, positive logic. "Logic 1" when Vin > 8V DC 2nd digital output: 0 / 24V, 10mA max
4	2nd analog input, 11-bit (0.05%). 0..10V, 0..20mA, 4..20mA. Digital input 3, positive logic. "Logic 1" when Vin > 8V DC.
5	+24V, 100mA reference output (for use with potentiometer).
6	Bipolar analog input, +/-12-bit (0.025%). Configurable for: 0..24V, 0..10V, -10V..10V, -24V...24V
7	0V (User GND). Connected to terminal 9
8	Analog output, 8-bit (0.25%). 0..10V, 4..20mA. Digital output: 0 / 24V, 20mA max
9	0V (User GND). Connected to terminal 7
10	User relay output. Potential free contacts. 30Vdc 5A, 250Vac 6A
11	User relay output. Potential free contacts. 30Vdc 5A, 250Vac 6A

Control Terminal 1	+24V User Output
Current Limit	100mA

Control Terminal 2	Digital Input 1
Positive Logic	
Digital Voltage Range	8 to 30V
Sample Time	8 ms

Control Terminal 3	Digital Input 1/"Drive Healthy Output" (Parameter Selectable)
Input Mode:	
Positive Logic	
Digital Voltage Range	8 to 30V
Sample Time	8 ms
Output Mode:	
Voltage Range	24V DC
Current Limit	10mA

Control Terminal 4	Digital Input 3 or Analog Input 2
Positive Logic	
Digital Voltage Range	8 to 30V
Sample Time	8 ms
Analog Input Formats	Voltage: 0 to 10V Current: 0 to 20mA, 4 to 20mA
Resolution	11 bit (0.05%)

Control Terminal 5	+10V Output
Minimum Resistance	1kΩ

Control Terminal 6	Bipolar Analog Input or Digital Input 4
Analog Input Formats	0 to 24V, 0 to 10V, -24 to +24V, -10 to +10V
Resolution	+/- 12 bit (0.025%)
Positive Logic	
Digital Voltage Range	8 to 30V
Sample Time	8 ms

Control Terminals 7 & 9	0 Volts
-------------------------	---------

Control Terminal 8	Analog or Digital Output
Analog Range	Voltage: 0 to 10V Current: 4 to 20mA
Digital Voltage Range	0 or 24V
Max Output Current	20mA

Control Terminals 10 & 11	User Relay Contacts
Voltage Rating	250 VAC / 30 VDC
Current Rating	6A / 5A
Contact Isolation	2.5kV
Function	No or NC, Parameter Selectable

Control Terminal Connections

The User Control terminals are available via an 11-way pluggable connector. All terminals are galvanically isolated, allowing direct connection to other equipment.

Do not connect mains supply voltages to any terminals other than the User relay output. Permanent damage will otherwise result.

All other inputs will withstand up to 30V dc without damage.

The functionality of the inputs and outputs is user configurable. All operating modes are set up via the parameter set.

Up to 100mA can be sourced from the User +24V output and up to 20mA from the analog output.

MANAGING THE KEYPAD

The drive is configured and its operation monitored via the keypad and display.

Changing Parameters

To change a parameter value press and hold the key for >1s whilst the drive displays **StoP**.

The display changes to **P-01**, indicating parameter 01.

Press and release the key to display the value of this parameter.

Change to the required value using the and keys.

Press and release the key once more to store the change.

Press and hold the key for >1s to return to real-time mode.

The display shows **StoP** if the drive is stopped or, if the drive is running, the display shows 'Real-Time' information e.g. speed

Reset Factory Default Settings

To reset factory default parameters, press , and for >2s. The display shows **P-dEF**.

Press the button to acknowledge and reset the drive.

STANDARD PARAMETERS QD:E

Par.	Description	Range	Default	Explanation
P-01	Maximum speed	P-02 to P-09 x 5 (max 500Hz)	50Hz (60Hz)	Maximum speed limit – Hz or rpm. See P-10
P-02	Minimum speed	0 to P-01 (max 500Hz)	0Hz	Minimum speed limit – Hz or rpm. See P-10
P-03	Acceleration ramp time	0 to 600s	5s	Acceleration ramp time from 0 to base speed (P-09) in seconds.
P-04	Deceleration ramp time	0 to 600s	5s	Deceleration ramp time from base speed (P-09) to standstill in seconds. When P-04=0, the deceleration ramp is set by P-24. Setting P-04=0 also activates dynamic ramp control, where the ramp may be extended automatically to prevent an O-Volt trip.
P-05	Stop mode select	0: Ramp stop (brown-out ride-through) 1: Coast to stop 2: Ramp to stop (fast stop)	0	If the supply is lost and P-05=0 then the drive will try to continue running by reducing the speed of the load using the load as a generator. If P-05 = 2, the drive will ramp to stop using the P-24 decel ramp with dynamic brake control when mains supply lost.
P-06	Energy Optimiser	0: Disabled 1: Enabled	0	When enabled, automatically reduces applied motor voltage on light load. Minimum value is 50% of nominal.
P-07	Motor rated voltage	0, 20V to 250V 0, 20V to 500V	230V 400V	Rated (nameplate) voltage of the motor (Volts). Value limited to 250V for low voltage drives. Setting to zero disables voltage compensation.
P-08	Motor rated current	25% -100% of drive rated current	Drive rating	Rated (nameplate) current of the motor (Amps).
P-09	Motor rated frequency	25Hz to 500Hz	50Hz	Rated (nameplate) frequency of the motor.
P-10	Motor rated speed	0 to 30 000 rpm	0	When non-zero, all speed related parameters are displayed in rpm.
P-11	Voltage boost	Size 1: 0.0 to 20.0% Size 2: 0.0 to 15.0% Size 3: 0.0 to 10.0% of max output voltage.	Motor power dependent	Applies an adjustable boost to the voltage output at low speed to assist with starting 'sticky' loads. For continuous applications at low speed use a forced ventilated motor.
P-12	Terminal / Keypad / MODBUS / PI Drive Control Mode Selection	0. Terminal control 1. Keypad control – fwd only 2. Keypad control – fwd and rev 3. MODBUS network control with internal accel / decel ramps 4. MODBUS network control with accel / decel ramp adjustment 5. User PI control 6. User PI control with analog input 1 summation	0	Primary Control Mode of the drive 0. Terminal control. 1. Uni-directional keypad control. Keypad START button does not reverse direction. 2. Bi-directional keypad control. Keypad START button toggles between forward and reverse. 3. Control via Modbus RTU (RS485) comms interface using the internal accel / decel ramps. 4. Control via Modbus RTU (RS485) comms interface with accel / decel ramps updated via Modbus. 5. User PI control with external feedback signal. 6. User PI control with external feedback signal and summation with analog input 1.
P-13	Trip log	Last four trips stored	Read only	Previous 4 trips stored in order of occurrence, with the most recent first. Press UP or DOWN to step through all four. The most recent trip is always displayed first. UV trip is only stored once. Further fault event logging functions are available through parameter group zero.
P-14	Extended menu access	Code 0 to 9 999	0	Set to "101" (default) for extended menu access. Change code in P-39 to prevent unauthorised access to the Extended Parameter Set.

Note: Standby mode is enabled automatically when the drive is at zero speed for > 20 seconds

BASIC PARAMETER SET QD:VT

Par.	Description	Range	Default
P1-01	Max speed limit (Hz or rpm)	P1-02 to 120Hz / 7,200 rpm	50Hz
P1-02	Min speed limit (Hz or rpm)	0 to P1-01	0Hz
P1-03	Accel ramp time (s)	0s ... 3000s	30s
P1-04	Decel ramp time (s)	0s ... 3000s	30s
P1-05	Stop mode select	0: Ramp to stop (mains ride through) 1: Coast to stop 2: Ramp to stop (Fast-Stop mode)	0
P1-06	Energy optimizer	0: Disable 1: Enable	0
P1-07	Motor rated voltage	0V, 20V to 250V 0V, 20V to 500V 0V, 20V to 600V	230V 400V
P1-08	Motor rated current (rms)	20% to 100% of drive current rating (Amps)	Drive rating (Amps)
P1-09	Motor rated frequency	25 to 120Hz	50Hz
P1-10	Motor rated speed	0 to 7,200 rpm	0
P1-11	Preset speed 1	-P1-01 (min) to P1-01 (max)	50Hz

QWAND	QWAND is a pocket PC that allows infra-red programming of QD Drives via the infra-red port on the front of the drive, supplied with software.			
572X0004	QWAND	•*	•	•
			<i>*only if used with QSTICK</i>	
QSTICK	QSTICK - For accurate repeat drive programming, simply insert the QSTICK into the RJ45 slot on the front of the QD:E drive with infra-red functionality			
572X0003	QSTICK for QD:E Drives	•		
QGATEWAY	QGATEWAY - Fieldbus Communications Fenner QD Drives can communicate with existing networks with the use of the QGATEWAY			
572X8001	Profibus gateway with RJ11 & RJ45, 9 way, D-type, data cables		•	•
572X8002	DeviceNet gateway with RJ11 & RJ45, 9 way, D-type, data cables		•	•
572X8003	EtherNet gateway with RJ11 & RJ45, 9 way, D-type, data cables		•	•

QSTICK

For fast accurate repeat drive programming. Simply insert QStick into the RJ45 slot on the face of the QD:E drive.

Key Benefits

- Upload/download buttons allow for fast copying of parameters between drives
- Infra-red communications capability provides remote control convenience
- Can be programmed with PDA or Smart Phone

QPORT REMOTE KEYPAD AND DISPLAY

QPort PLUS and QPort E are intelligent devices with a built in microcontroller.

Key Benefits

- Real time keypad and display operation mimics Fenner drive
- Single electrical interface for power and data
- Communicates with up to 63 drives on a network
- Automatically connects to specified drive
- IP54 rated when mounted on a panel
- Bright LED display with membrane keypad
- Parameter lock function available
- 3m Data Cable included

QPort units act as the remote keypad and display for the QDrive on the network which has the same serial address. The physical layout and the operation of the QPort keypad and display mimic the QD drive exactly.

QBRAKE - DYNAMIC BRAKING RESISTORS

Key Benefits

- Fenner QD drive software protects the QBRAKE from overload, hence no need for expensive overload relays
- Internal fusible element ensures fail safe operation
- Connects to side of drive, using the heatsink of the drive to prevent overheating
- No space envelope penalty, fits on side of the drive
- Series/parallel arrangements for more demanding applications

QBRAKE dynamic braking resistors are designed specifically for the Fenner QD range. For use with high inertia loads which need to be stopped rapidly. QBRAKE dynamic braking resistors assist the drive in managing the electrical energy returned from the motor during braking, by converting it to heat energy.

QRELAY-3

QRELAY-3 provides 2 additional programmable relay outputs

QRELAY-2

QRELAY-2 provides a second relay output.

QRELAY-VT

QRELAY-VT provides 2 relays for typical 'drive running' and 'drive tripped' indicators.

Product Code	572X4003
Max. relay switching voltage	250V AC / 220V DC
Max relay switching current	1A
Max input voltage	+/- 50V DC
Conformity	IP00, UL94V-0
Environmental	-10°C ... +50°C
Dimensions	56 x 33 (not pins) x 14mm

Product Code	572X4002
Max. relay switching voltage	250V AC / 220V DC
Max relay switching current	1A
Max input voltage	+/- 50V DC
Conformity	IP00, UL94V-0
Environmental	-10°C ... +50°C
Dimensions	56 x 33 (not pins) x 14mm

Product Code	572X4100
Max. relay switching voltage	250V AC / 220V DC
Max relay switching current	1A
Max input voltage	+/- 50V DC
Conformity	IP00, UL94V-0
Environmental	-10°C ... +50°C
Dimensions	56 x 33 (not pins) x 14mm

Fenner®

HIGH EFFICIENCY ELECTRIC MOTORS

The Fenner FM:P Series industrial motor range is designed to meet today's industrial requirements high efficiency, long life and value for money.

- EFF1 premium efficiency and ECA compliant
- Aluminium (multimount) <132 frame and cast iron from 160 frame and above
- 2, 4, 6 and 8 pole
- Foot, flange and face mounted options from stock

Electric Motors Design Data Required

- Power required (kW or HP)
- Motor speed required (rpm or No. Poles)
- Mains voltage supply (volts / phases / frequency)
- Mounting type (foot, flange, face, etc)
- Mounting position (horizontal / vertical)
- Enclosure (IP Rating)
- Existing / required frame size
- Method of starting (Star, Delta, D.O.L. inverter etc)
- Construction (aluminium / cast iron)
- Special features required

Buying a High Efficiency **EFF1** Electric Motor

WHY IS IMPROVING MOTOR EFFICIENCY IMPORTANT?

Over 60% of all electrical energy consumed by industry in the UK is used by electric motors.

Improving the efficiency of electric motors and the equipment they drive can save energy, reduce operating costs, improve productivity and reduce our nation's carbon footprint

Energy efficiency should be a major consideration when you purchase or rewind a motor. The annual energy cost of running a motor is usually 100 times its initial purchase price.

A premium efficiency motor requires less input power to do the same job as a standard efficiency motor.

Premium efficiency motors have an improved design, higher quality materials and advanced manufacturing techniques than standard motors.

A premium efficiency motor reduces energy losses by up to 40%, this means that if a 15kW motor is operating for 6000 hours per year, savings of nearly 4 MWh per year can be made.

NEW MEPS STANDARDS FOR ELECTRIC MOTORS

In 2007 a project for a new harmonised global standard known as MEPS (Minimum Efficiency Performance Standards) was initiated. IEC60034-30 was published in 2008 and is set to come into force in June/July 2011.

The new efficiency bandings will be known as IE1, IE2 and IE3. They will run side by side the existing EFF1 and EFF2 bands for a period to enable stock to be moved.

The new banding has now been extended to include 2, 4 and 6 pole motors from 0.75kW to 375kW.

The existing IEC60034-2 (EFF1 and EFF2 scheme) has a tendency to over-estimate efficiency. It does not allow a fair comparison of motors with low and high additional load losses as it only estimates a fixed allowance of 0.5% of the input power. It also fails to take into account the effects of ambient temperature and altitude. The new standards will provide a far more accurate measure of efficiency and thus enable a fair comparison of global manufacturers.

FENNER FM:P PREMIUM EFFICIENCY MOTORS

The FM:P series of motors is a Premium Efficiency design currently labelled as EFF1 and soon to carry the IE2 MEPS certification.

All FM:P motors are fitted with Thermistors as a standard option and larger B3 motors have Roller bearings ideal for Belt Drives.

SELECTION PROCEDURE

The output powers published overleaf are based upon continuous maximum rating conditions. Therefore design factors for above average running periods do not normally affect the selection. These ratings assume a normal operating condition at an ambient temperature not exceeding 40°C at an altitude below 1000 metres. Correction factors for other conditions are given below.

Permitted Frequency of Starts

When a motor is stopped and restarted too frequently, overheating will occur. Specific results depend upon the relative inertia of the motor and of the driven machine so it is not possible to publish meaningful figures. If in doubt contact your local Fenner authorised distributor.

Noise and Vibration

The FM:P range of motors comply with international recommendations relating to maximum permitted noise levels. All rotors are dynamically balanced, with a key fitted, in order to ensure that vibration levels do not exceed class N, ISO 2373.

Derating Table for Different Ambient Temperatures and Altitudes

Ambient Temp °C	Power available as % of published figure at following altitudes (metres)						
	1000	1500	2000	2500	3000	3500	4000
25	100	100	100	100	100	100	100
40	100	97.0	94.5	92.0	89.0	86.5	83.5
45	96.5	93.5	91.0	89.0	86.0	83.5	80.5
50	93.0	90.0	88.0	85.5	83.0	80.5	77.5
55	90.0	87.5	85.0	83.0	80.0	78.0	75.0
60	86.5	84.0	82.0	79.5	77.0	75.0	72.0

Motor bearings are charged with grease suited for ambient temperatures in the range -30°C to 55°C.

Starting torque and nominal torque

M_s : The starting torque is the mechanical torque developed by the motor with the rotor locked.

M_N : The nominal torque is the mechanical torque that the motor is developing when it is giving its nominal power and speed.

Starting current and nominal current

I_N : The nominal current is the current that the motor is developing at nominal power and nominal voltage.

I_s : The starting current is the current that the motor is developing when the rotor is locked.

Bearing Life

Bearing life depends on factors such as bearing load, rotation, speed, and operating temperature of the bearing. Standard electric motors are fitted with bearings of sufficient capacity for normal overhung or axial loads. If bearing capacity is in doubt consult your supplier with full application details.

Mounting Positions

Although motors are normally stocked in either the B3 or B5 assembly format, it is in most cases possible to mount them in any of the alternative mounting arrangements shown in the motor mounting arrangements table without further modification, but it is essential that the actual mounting is specified at the time of order.

Fenner High Efficiency Motors Specification

- **Class F Insulation**
Class F insulation with class B temperature rise.
- **IC 411 Cooling**
Surface cooled to IC 411 according to IEC 34-6.
- **IP55 Protection**
Achieves an IP55 classification according to IEC34-5.
- **Motor Frame**
Manufactured in high strength aluminium up to 132 frame and high grade cast iron 160 frame and above.
- **Stator**
Constructed from high grade electrical steel laminations.
- **Rotor**
Dynamically balanced squirrel cage rotor is made from cast aluminium shrunk onto the shaft.
- **Bearings and Seals**
Deep groove ball bearings with shields are normally used.
- **Warranty and Support**
The comprehensive 12 month warranty is complemented by full technical support from your local authorised distributor.

Ordering Instructions

All Fenner electric motors are identified by a product code number. This consists of an eight digit code depending on the motor type, frame size, mounting, speed and power.

These codes should be included on all enquiries, correspondence and orders.

FIRST THREE DIGITS:

Motor material and efficiency

Code	Range	Material
170	Standard Efficiency	Aluminium
171	Standard Efficiency	Cast Iron
172	Premium Efficiency	Aluminium
173	Premium Efficiency	Cast Iron

FOURTH DIGIT:

Frame size

Code	Frame
A	56
B	63
C	71
D	80
E	90
F	100
G	112
H	132
J	160
K	180
L	200
M	225
N	250
P	280
R	315
S	355
T	400
U	450
V	500
W	560

FIFTH DIGIT:

Mounting type

Code	Mounting	Description
1	B3	Foot mounted
2	B5	Flange mounted
3	B35	Foot & Flange mounted
4	B14	Face mounted
5	B34	Foot & Face mounted
6	B14B	DIN standard Face mounted
7	B34B	Foot & DIN standard Face mounted

SIXTH DIGIT:

Nominal output speed

Code	Poles	Nominal Speed
2	2	3000
4	4	1500
6	6	1000
8	8	750
1	10	600
3	12	500

SEVENTH & EIGHTH DIGITS:

Rated output power

Code	kW	Code	kW
01	0.06	32	75
02	0.09	33	90
03	0.12	34	110
04	0.18	35	132
05	0.25	36	150
06	0.37	37	160
07	0.55	38	180
08	0.75	39	185
09	1.1	40	200
10	1.3	41	225
11	1.4	42	250
12	1.5	43	280
13	1.8	44	315
14	2.0	45	355
15	2.2	46	400
16	3.0	47	450
17	3.7	48	500
18	3.8	49	560
19	4.0	50	630
20	5.5	51	710
21	7.2	52	750
22	7.5	53	800
23	9.0	54	815
24	11.0	55	850
25	15.0	56	900
26	18.5	57	1000
27	22.0	58	1120
28	30.0	59	1200
29	37.0	60	1250
30	45.0	61	1400
31	55.0	-	-

NINTH DIGIT:

Options Code

Code	Description
A	Anti-condensation heaters
B	Ball bearing option on cast iron B3 motor
C	Rain canopy for V1 motor
T	Thermistors fitted (if not standard)
N	Failsafe brake and hand release
Z	Force vent motor
Q	Special motor

**FM:P Series - 2 Pole - 3000 rpm**

230/400V - 50Hz - up to 2.2kW

400/690V - 50Hz - up to 3.0kW

Fitted with thermistors as standard, NU bearings on all foot mounted cast iron motors

Frame Size EN600034 (IEC-DIN)

Frame Size	Product Code	Frame Material	Rated Output Power P_N kW	Rated Current			Full Load Speed $n_{full\ load}$ rpm	Full Load Factor $\cos \phi$	Efficiency		Full Load Torque M_N Nm	Starting Current I_s/I_n A	Starting Torque M_s/M_n	Pull Out Torque M_k/M_n	Sound Pressure Level dB(A)	Moment of Inertia $J = \frac{1}{4}GD^2$ kgm ²	Weight Foot Mounted kg

* Replace * in Part number with desired mounting configuration (1=B3 / 2=B5 / 3=B35 / 4=B14 / 5=B34)

• Indicates that this motor is ECA compliant # Indicates no thermistors fitted

Motors in the range of 1.1 - 90kW exceed CEMEP EFF1 minimum efficiency levels

All technical details are based on 400V/50Hz

Motors from 110 to 400kW exceed the minimum efficiency levels stipulated by WIMES specifications

Where standard ball bearings are required on the drive end add B to the end of the product reference.

FM:P Series - 4 Pole - 1500 rpm

230/400V - 50Hz - up to 2.2kW

400/690V - 50Hz - up to 3.0kW

Fitted with thermistors as standard, NU bearings on all foot mounted cast iron motors

* Replace * in Part number with desired mounting configuration (1=B3 / 2=B5 / 3=B35 / 4=B14 / 5=B34)

• Indicates that this motor is ECA compliant # Indicates no thermistors fitted

Motors from 5.5 to 315kW exceed efficiency levels stipulated by WIMES specifications

All technical details are based on 400V/50Hz

Where standard ball bearings are required on the drive end add B to the end of the product reference.

FM:P Series - 8 Pole - 750 rpm

230/400V - 50Hz - up to 2.2kW

400/690V - 50Hz - up to 3.0kW

Fitted with thermistors as standard, NU bearings on all foot mounted cast iron motors

All Dimensions are in mm

* Additional footholes on NDE

315S/M frame at 508mm centres from front holes

355M frame at 560mm centres from front holes

355L frame at 630mm centres from front holes

400M/L frame at 710mm centres from front holes

Attention!

These motors are designed for use with belt and chain drives and are fitted with a NU bearing in the DE for optimum performance.

If there is no overhung load expected, please add the suffix **B** to your reference for a ball bearing to be fitted.

Motors supplied as B35 are fitted with a ball bearing as standard

Permissible Radial Loads

Where: D = diameter of the pulley (mm)
 P = power of the motor (kW)
 n = motor rated speed (Rev/min)
 k = belt tension factor, k=2.0 - 2.5 for V-belts
 FR(x) = permissible radial force (N)

Allowable Radial Loads for Horizontal and Vertically Mounted Fenner FM:P & FM:S Motors

The following tables give the permissible radial forces in Newtons assuming zero axial force **. In case of higher radial force than given in the ball bearing column a NU selection must be made. The values are based on normal conditions at 50Hz and calculated at 20,000 working hours for the 2 pole motors and 40,000 working hours for 4, 6 and 8 pole motors. For 60Hz the value must be reduced by 10%.

$$D = \frac{1.9 \times 107 \times k \times P}{n \times FR (X_0 / X_{1/2} / X_{max})}$$

** = if axial loads are expected, please consult your local Authorised Fenner Distributor.

Permissible Axial Loads for Horizontal and Vertical Fenner Motors

The following table gives the permissible axial forces in Newtons, assuming zero radial force**. In this case the motor should be ordered with standard ball bearings.

If the axial force is greater than that given in the table, an angular contact bearing should be ordered. The values are based on normal conditions at 50 Hz and calculated at 20.000 working hours for two pole motors and 40.000 hours for 4, 6 and 8 pole motors. At 60Hz the values must be reduced by 10%.

Fpressure is calculated for a fixed bearing at the DE.

** If FR and FA both apply contact your local Fenner Authorised Distributor.

*EQ = SKF Explorer Quality
 Bold type indicates standard bearings.

Electrical Connections

Connection cables and earthing requirements should conform to IEE regulations.

It is recommended that a suitable overload is fitted to protect the motor windings. Line fuses only protect the cables from short circuit not the motor.

Ensure that all terminals are tight and that the correct terminal arrangements are observed.

All motors are capable of running with two voltages.

Smaller motors are suitable for a 230/400V supply and larger motors are suitable for a 400/690V supply.

It is only possible to use a 400V Star/Delta starter on motors that are wound 400/690V - for this type of start, links must be removed.

Terminal Marking and Direction of Rotation

In accordance with the current standard, if the supply is connected to the motor's stator terminals, which are marked U1, V1 and W1 and the phase sequence of supply is 1, 2 & 3, then the direction of rotation will be clockwise when viewed from the drive-end.

MOTOR SLIDE BASES

Fenner motor slide bases cover the full range of motors up to frame size 280.

Slide Bases are available in two versions:

- The MPB is a heavy duty single plate base available for motors from 90 to 280 frame.
- The MB is a lightweight and easy to mount dual-plate base available for motors from 56 to 132 frame.

Compare the features and benefits of Fenner bases with your current method!

Both ranges are specifically designed for extreme drive loads and are manufactured without welding in heavy gauge pre-slotted galvanised steel for maximum resistance to corrosion.

For Offshore and special process applications all bases can be supplied to special order coated or manufactured in Stainless Steel.

Unlike slide rails the development of the Motor Slide Base has been market led. A new technology offering the manufacturer reductions in design errors, time savings in production

and thus cost savings over the whole manufacturing process.

Maintenance and production engineers now have the ability to maintain absolute belt alignment throughout the drive tensioning process meaning fast in situ belt tensioning without the removal of guards and thus no plant down time.

Features

- Large range accommodating motor frames from 56 - 280
- Fully adjustable operation
- Compact design
- Robust and plated screw adjustment
- Pre slotting for precision adjustment
- No welding points
- Availability in Galvanised or Stainless Steel
- Usage for friction drives, pumps, chain drives
- Usage with all types and makes of motors

Benefits: Original Equipment

- Competitive Price
- Reduces design errors
- Reduces design time
- Reduces fitting time
- Reduces positioning time
- No drilling required to fit
- Accurate and positive alignment every time
- Ex-stock deliveries Nation-wide

Benefits: Maintenance

- No plant down-time
- Institute drive adjustment
- Drive tensioning without removal of guards
- Corrosion resistant finish
- Rapid adjustment feature (optional)
- Totally maintenance free

FENNER SLIDE RAILS

Are made from fabricated steel to provide a simple and accurate method of mounting electric motors to machine bed plates. Each product code refers to one complete set for one motor and includes slide rails, tensioning bolts and motor mounting bolts.

**Brake Motors (M/N)**

Fenner Brake motors are available with (N) or without (M) Hand release lever and are standard failsafe brakes rectified in the terminal box from the supply to the motor terminals. When a supply voltage is sent to the motor, the rectifier is energised releasing the brake and allowing the motor to run. When the voltage is removed, the brake coil is de-energised and the spring applies the brake to stop the motor.

Force Vent Motors (Z)

Fenner motors are available with fixed speed cooling systems for applications that require speed control via an inverter below 25Hz operation.

The "Z" series force-vent units are pre-wired for a 230V 1 phase supply but the capacitor can easily be removed to operate on a 230/400V 3 phase 50Hz supply.

These blowers are enclosed to IP66 and come with a separate terminal box for electrical connections to be made.

Clutch/Brake Units (L)

Fenner Clutch/Brake units (Series L) are designed to fit between motor and gearbox using a standard B5 IEC flange. The range is available for 63-112 frames and are sealed to IP55 and controlled by 24V DC signal.

Fenner Disc Variators (X)

Fenner Disc Variators use a friction system to vary drive transmission speed. To correctly select a variator, you need to know the required torque and refer to the selection tables below.

Care must be taken to ensure that the number of starts does not exceed 10 per minute. You should apply an appropriate service factor to the variator selection to ensure that there is sufficient torque for the application.

The Fenner variator range offers an IEC B5 flange on both input and output to enable fitting between gearhead and standard motor. The range is available in 63-90 frame in Aluminium design and from 100-132 frame in a Cast Iron housing.

Speed range is available as 5:1 or 6:1 depending on the size of the unit - refer to selection tables below.

The range offers silent, vibration-free running while maintaining a relatively high efficiency.

SELECTION

Motor Size	2P	Speed Range	Output Torque	4P	Speed Range	Output Torque

Lubrication

The Fenner range of variators are pre-filled for use in a horizontal mounting position. Should the mounting position be different it is important to top up the lubricant according to the table below.

Sizes X02 / X05 and X10 are maintenance free but larger units require routine maintenance - for details of oil changes and lubricant type please refer to installation and maintenance instructions supplied with unit.

Size	B3/B5	B6/B7	B8	V1	V5	V3	V6

Control Options

The standard Control wheel can be positioned on either side of the variator. The standard position is on the LEFT Hand side as viewed from the motor side of the unit when control shaft is at the top.

An alternative Gravitational Indicator is also available which indicates the operational speed. The position of the handwheel is necessary to ensure supply of the correct component - see below for details.

Fenner® SERIES M COAXIAL

The innovative Fenner Series M coaxial gearbox combines high load carrying capacity with high efficiency and reliability suitable for a wide variety of applications.

- Drives up to 90kW
- Dimensionally interchangeable with the market leaders
- High ratio combinations available in multi-stage units
- Oil tight gearhead enables motor removal without spillage
- Accepts standard IEC motors without modification
- ATEX Certification available

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?**
electrical supply available
- **If motorised:**
any special motor features required (brake, thermistors, flameproof etc.)
- **If non-motorised:**
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Foot mounted or flange mounted?**
if flange mounted, flange diameter required
if foot mounted, is an output shaft coupling required?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

MOTORISED UNITS SELECTION PROCEDURE

(a) Service Factor

From Table 1 select the Mechanical Service Factor (**Fm**) applicable to the drive. If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor **Fm** by Factor **Fs** from table 2.

(b) Motor Power

Refer to the selection tables on pages 190 to 201 and choose a motor power equal to or in excess of that required, if the motor power is not known then from the formula below determine the power requirements of the driven machine and select a motor power in excess of the calculated machine absorbed power.

$$P_A = \frac{T \times N_2}{9550}$$

PA = Machine absorbed power (kW)
T = Machine absorbed torque (Nm)
n₂ = Machine speed (Rev/Min)

(c) Unit Selection

Refer to the selection tables on pages 190 to 201 and choose a motor power equal to or closest above that calculated in step (b). Then read down the column headed "Nominal Output" until a speed equal to or near to the required speed is found. On this line read across to the service factor column and check that the service factor exceeds the value from step (a). If the service factor is either lower or much higher than that required check the speeds at each side of the required speed to see if a more suitable unit and factor can be found.

(d) Overhung and Thrust Loading

If an indirect drive is used between the gearmotor and the driven machine, then the overhung load should be calculated using one of the formula on page 215. This value should be compared with the maximum allowable value given in column 5 of the selection tables. If the value exceeds the maximum allowed, then either re-design the indirect drive or select a larger unit capable of supporting the overhung load.

EXAMPLE 1

A Series M foot mounted gearmotor is required to drive a uniformly loaded mixer using a 4 kW electric motor at 88 rev/min. The mixer operates 8 hours a day and stops and starts every hour. A coupling is to be used to connect the gearmotor to the mixer.

(a) Service Factor

From table 1 below the service factor for a Uniformly Loaded Mixer is 1.0. The mixer stops and starts every hour therefore the stop/start factor is 1.0

(b) Motor Power

Series M gearmotor units fitted with 4 kW motors are described on page 195.

(c) Unit Selection

Reading down the column headed "Nominal Output," it is found that there are two unit selections at 88 rev/min, at the first one of these read across to the maximum service factor column, it can be seen that the unit size 862A2046 has

a service factor of 1.07. This exceeds the 1.00 service factor required and therefore is suitable for the application. The fourth digit (letter A) signifies a foot mounted unit, therefore the code is correct for the unit required. If another mounting style is required a different letter is used in place of the A, for details see page 217.

(d) Overhung and Thrust Loading

As no external loads are present, no further checks are necessary.

EXAMPLE 2

A non-uniformly loaded conveyor absorbs 1600 Nm at the head shaft which has to rotate at 52 rev/min. A 2:1 chain-drive utilising a triplex chain drive with 19T + 38T sprockets connects the head shaft drum to a foot mounted gearmotor.

The conveyor stops and starts 4 times a day. Select a suitable size Series M gearmotor for over 16 hours a day operation.

(a) Service Factor

From table 1 below the Service Factor is 1.50
From table 2 the starting factor is 1.00.

(b) Motor Power

As the motor power is not known, it is necessary to calculate the power requirements of the driven machine with the following formula:

$$\begin{aligned} \text{Machined absorbed power} &= \frac{1600 \times 52}{9550} \\ &= 8.71 \text{ kW} \end{aligned}$$

The nearest motor is an 11.0kW motor and is found on page 196-197.

(c) Unit Selection

Reading down the column headed "Nominal Output" it is found that 100 rev/min is nearest to the required output speed of 104 rev/min and by referring to the column headed "Service Factor" the only gearmotor selection at this speed has a service factor of 2.46 which is more than adequate for the application. The code for this selection is seen to be 865A1966. As the service factors for the two units at speeds above and below 100 rev/min are inadequate for the application the 865A1966 is selected.

(d) Overhung and Thrust Loading

As the 19-T sprocket will impose a radial load on the gearmotor output shaft, it is necessary to calculate its value by using the formula below. See page 215 for further explanation.

$$\begin{aligned} \text{Overhung load} &= \frac{\text{Torque} \times 1000 \times K}{r} \\ &= \frac{800 \times 1000 \times 1.0}{77.16} \\ &= 10368 \text{ N.} \end{aligned}$$

The maximum overhung load value for 865A1966 unit selected is 21675N which exceeds the value calculated above and is therefore suitable for the application.

TABLE 1 - MECHANICAL SERVICE FACTOR (Fm)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25
Moderate Shock Loads Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Pumps – reciprocating with 3 or more cylinders Pump and Paper Making Machinery Rubber Mixers and Calendars Screens – rotary Textile Machinery	1.00	1.25	1.50
Heavy Shock Loads Brick Presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Pumps – reciprocating, 1 or 2 cylinders Rubber Masticators Screens – vibrating	1.50	1.75	2.00

* See page 398 for notes on reducing service factors

TABLE 2 - STARTING SERVICE FACTOR Fs

Factor Fs	Start/stops per hour					
	Up to 1	5	10	40	60	>200
	1.00	1.03	1.06	1.10	1.15	1.20

For ATEX certified gear units please consult your local Authorised Distributor.

For ATEX certified gear units please consult your local Authorised Distributor.

Series M

Fenner®
THE LANGUAGE OF POWER TRANSMISSIONS

Flexible and Efficient The Cost Effective Alternative

- Dimensionally interchangeable with market leaders
- Versatile mounting
- Backstops easily fitted
- Oil tight gearhead enables motor removal without modification
- Accepts standard IEC motors
- Ratios from 1.5:1 to 11,000:1

SELECTION OF NON-MOTORISED REDUCER UNITS

(a) Service Factor

From Table 1 select the Mechanical Service Factor (**Fm**) applicable to the drive. If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor **Fm** by Factor **Fs** from table 2.

(b) Power Required

Determine either the absorbed torque (Nm) or the input power (kW) required by the machine.

The absorbed Torque can be calculated using the following formula:

$$T = \frac{P \times 9550}{n_2}$$

T = required output torque (Nm)

P = absorbed power (kW)

n_2 = machine speed (Rev/Min)

(c) Design Power

Multiply either the absorbed torque (Nm) or the power (kW) by the service factor determined in (a)

(d) Ratio Required

Divide the input shaft speed by the required output shaft speed to determine the gear ratio.

(e) Unit Selection

In the selection pages: 205 to 210 refer to the gear ratio closest to the value determined in step (d).

Check in column 2 for the nearest input shaft speed, then read across the table at this speed until a unit is found with either an output torque or input power that equals or exceeds the design power value determined in step (c) above. Column 3 gives the approximate output shaft speed for the selected speed and ratio combination.

TABLE 1 - MECHANICAL SERVICE FACTOR (Fm)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25
Moderate Shock Loads Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Pumps – reciprocating with 3 or more cylinders Pump and Paper Making Machinery Rubber Mixers and Calendars Screens – rotary Textile Machinery	1.00	1.25	1.50
Heavy Shock Loads Brick Presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Pumps – reciprocating, 1 or 2 cylinders Rubber Masticators Screens – vibrating	1.50	1.75	2.00

* See page 398 for notes on reducing service factors

TABLE 2 - STARTING SERVICE FACTOR Fs

Factor Fs	Start/stops per hour					
	Up to 1	5	10	40	60	>200
	1	1.03	1.06	1.1	1.15	1.2

Non Motorised Selection

Double reduction units are shown in normal typeface

Bold typeface indicates triple reduction units

Also available in quadruple and quintuple reduction units as tandem units, please consult your local Authorised Distributor for details.

Overhung Load Capacities

ALLOWABLE OVERHUNG LOADS

Units are fitted with input and output bearings of ample proportions to cater for the radial and thrust loads imposed by the gear loads, leaving sufficient capacity for taking overhung loads.

The calculated overhung load should be compared with the value in the selection tables.

These values may be exceeded at lower input speeds or if limited bearing lives are acceptable. In cases where higher overhung load capacities are necessary consult your distributor, quoting details of power, speed, direction of gearbox rotation, angle of application of load, distance of load application from gearbox and acceptable bearing life.

Permissible overhung loads vary according to the direction of rotation. The values tabulated are for the most unfavourable direction with the unit transmitting full rated power and the load applied midway along the shaft extension. Hence they can sometimes be increased for a more favourable direction of rotation, or if the power transmitted is less than the rated capacity of the gear unit, or if the load is applied nearer to the gear unit case. Refer to your Distributor for further details. In any event, the sprocket, gear etc. should be positioned as close as possible to the gear unit case in order to reduce bearing loads and shaft stresses, and to prolong life.

All units will accept 100% momentary overload on stated capacities.

To determine the overhung load when a sprocket, gear or 'V' pulley is fitted to either shaft, one of the following formulae may be used in the absence of accurate information.

(1) Calculation on a basis of Torque

$$\text{Overhung load (N)} = \frac{T \times 1000 \times K}{r}$$

(2) Calculation on a basis of Power

$$\text{Overhung load (N)} = \frac{kW \times 9550 \times 1000 \times K}{n \times r}$$

Where:

- T = Absorbed torque at shaft in Nm.
- kW = Absorbed power at shaft in (kW).
- r = Pitch radius of sprocket, gear or 'V' pulley in mm.
- n = Rev/min of shaft
- K = Application factor -
 - 1.00 for a sprocket
 - 1.25 for a gear or timing pulley
 - 1.50 for a 'V' pulley

Overhung loads may be reduced by one of the following methods:

- (1) Increase the diameter of the sprocket, gear or pulley within reasonable limits.
- (2) Mount the sprocket, gear or pulley on a separate shaft, supported with bearings and couple to the output shaft by means of a Fenner shaft coupling.

(3) Use a special extended output shaft and support the free end with an outrigger bearing.

Axial Thrust Capacities (N)

No check or calculation is required for axial loads towards or away from the unit up to 50% of the permissible overhung load. If the axial thrust exceeds these values or if there is a combination of axial thrust loads and overhung loads please refer to your local Authorised Distributor.

Output shaft dimensions refer to both motorised and non motorised units.

DISTANCE MIDWAY ALONG SHAFT EXTENSION

* For Output Shaft Overhung Load Capacities see the relevant selection tables

Freedom from vibration and correct alignment are the two main points to be considered when installing Gearmotors. Attention to these points will prolong the life and efficiency of the entire drive.

The shafts of the prime mover, unit and driven equipment, should be in as perfect alignment as possible. Misaligned shafts impose abnormal stress on bearings and couplings, leading to excessive wear and possibly early failure. Vibration accelerates bearing and gear wear, resulting in noisy operation. Alignment can be maintained and vibration eliminated, by mounting the drive on rigid foundations of adequate proportions and dowelling the units in position.

Fenaflex couplings are recommended when the shaft alignment cannot be assured and also when protection from peak and vibratory torques is desirable. After installation, regular inspection should be carried out to check the tightness of the fixing bolts and also the accuracy of alignment.

LUBRICATION

Gearmotors and Reducers

Sizes 860 to 863

Motorised and Reducer types of sizes 860 to 863 are supplied ready filled with the appropriate amount of lubricant for the mounting position identified in the original order. (If the unit is to be mounted in a different position to that originally intended then the amount of lubricant in the unit will require amending - see table below for required quantities).

Sizes 864 to 868

Motorised and Reducer types of sizes 864 to 868 are despatched without oil for the customer to fill on site once installed. The different mounting positions are indicated below

LUBRICANT QUANTITIES (LITRES)

Mounting Position	860		801		861		802		862		803		863		864		865		866		867		868

MOUNTING POSITIONS

BREATHERS/MOUNTING POSITIONS

Sizes 860,801 and 861 are supplied for operation without breathers.

Sizes 802 to 863 are supplied for operation with breathers. To prevent leakage during transit these units are fitted with blanking plugs. It is essential that when the unit is in its operating position the relevant blanking plug is removed and replaced by the breather plug (supplied) in the position indicated on the installation leaflet.

Sizes 864 to 868 are supplied for operation fitted with a breather but are despatched without oil.

It is essential that when the unit is in its operating position the relevant blanking plug is removed and replaced by the breather plug (supplied) in the position indicated on the installation leaflet. **The mounting position should always be specified on ordering.**

LUBRICANT TYPE TEMPERATURE RANGE

ISO Viscosity	Ambient Temperature °C			
	-5°C to 20°C	-30°C to 20°C	0°C to 35°C	20°C to 50°C
EP Mineral Oil	220	-	320	460
Synthetic Oil 1	-	220	220	320
Synthetic Oil 2	-	220	320	460

Synthetic Oil 1 = Polyalphaolein based.

Synthetic Oil 2 = Polyglycol based

The recommended lubricants for Series M are EP mineral oil or synthetic oil type 1.

with the appropriate oil levels. The units have several oil fill and drain plug locations to cater for all mounting positions. A list of approved lubricants is supplied in the table below. All sizes will require an oil change at regular intervals depending on the operating temperature. Initial fill of oil should be changed in a new gear unit after 1000 hours operation or one year or half the life shown in the table.

Warning: Do not overfill as excess lubricant may cause overheating and leakage.

Oil Changes

Sizes 860 to 863 are lubricated for life except when the units are required to work in an explosive atmosphere. (94/9/EC Atex 100a Group II category 2 zones 1 & 21 & category 3 zones 2 & 22). See separate leaflet for recommendations. All other sizes will require an oil change depending on the unit operating temperature. Initial fill of oil should be changed in a new gear unit after 1000 hours operation or one year or half the life in the table below.

Unit Op Temp °C	Renewal Period (Hours)	
	Mineral Oil	Synthetic Oil
75 or less	17000 or 3 yrs	26000 or 3 yrs
80	12000 or 3 yrs	26000 or 3 yrs
85	8500 or 3 yrs	21000 or 3 yrs
90	6000 or 2 yrs	15000 or 3 yrs
95	4200 or 17 mths	10500 or 3 yrs
100	3000 or 12 mths	7500 or 2.5 yrs
105	2100 or 8 mths	6200 or 2 yrs
110	1500 or 6 mths	2100 or 18 mths

RECOMMENDED OIL GRADES

Supplier	Mineral Oils Containing EP Additives	Synthetic Lubricants Polyglycol Based	Synthetic Lubricants Polyalphaolefin based

Fuchs	Renogear V or WE	Renolin PG	Renogear SG
Mobil	Mobilgear 600	Glygoyle	Mobilgear SHC
Shell	Omala or Omala F	Tivela or Tivela S	Omala HD
Texaco	Meropa or Meropa WM	Synlube CLP	Pinnacle EP
Total	Carter EP	Carter SY	Carter EP/HT
Rocol	Sapphire Hi-Torque	-	-

† Gear units for use in mounting positions V1, V3, V5 and V6 should only be selected with overall ratios greater than or equal to those shown in the table below.

* Mounting positions V3 & V6 are not recommended for geared motors. Please consult your local authorised distributor.

Unit Size	Input Speed (rpm)			
	1000	1500	1800	>1800
860-864	All	All	All	Consult your local distributor
865	2:1	4:1	4.5:1	
866	4:1	8:1	9:1	
867	6.3:1	11:1	14:1	
868	12:1	18:1	22:1	

All gearboxes and geared motors are identified by an eight digit code for a unit with a standard electric motor, if a special motor type is required a ninth digit is added to the end of the normal code. These codes should be included on all enquiries, correspondence and orders.

The code is made up as follows:-

FIRST THREE DIGITS: Gearmotor type and size. Select from the tables on pages 190-201 and 205-210.

FOURTH DIGIT: Type of assembly required

- A:** Foot mounted motorised
- B:** Flange mounted motorised
- D:** Foot mounted with input shaft
- E:** Flange mounted with input shaft
- G:** Foot mounted - motor ready
- H:** Flange mounted - motor ready

FIFTH/SIXTH DIGIT: Ratio code

1. Assemblies A and B use the complete eight digit code obtained directly from the selection tables.
2. Exact gear ratios can be found on page 214.
3. For selection and specification of D & E reducer units, select from tables on page 205-210 and create code as shown.
4. For selection of motor ready units (types G & H) use motor selection tables and replace motor codes with frame codes.

SEVENTH/EIGHTH DIGIT: Type of drive code

1. Motorised units - use complete code from selection tables with if applicable, additional ninth digit for motor type.
2. Input Reducer assembly - use **00**.
3. Motor ready units are supplied to fit standard IEC motors. Insert frame code from the table below.

Code	Frame	Flange
63C	63	B14
63D	63	B5
71C	71	B14
71D	71	B5
80C	80	B14
80D	80	B5
90C	90	B14
90D	90	B5
10C	100/112	B14
10D	100/112	B5
13D	132	B5
16D	160	B5
18D	180	B5
20D	200	B5
22D	225	B5
25D	250	B5

NINTH DIGIT: Type of motor variant

Use eight digit code obtained from selection tables for required motor power and speed and then add the relevant letter code from table below of the motor variant required.

ELECTRIC MOTOR VARIANTS

All variants of standard IEC motors can be fitted to Fenner Gearmotors, Series M is also capable of accepting NEMA motor variants as well.

Examples of some of the variants and their ninth digit code letter are:-

CODE	ADDITIONAL FEATURE
A	Anti-condensation heaters fitted
B	Backstop Fitted
E	Fitted with Encoder
L	Clutch/Brake Unit
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer to Original Quote - Special
S	Single Phase motor
T	Fitted with Thermistors
X	Fitted with Variator
Z	Fitted with Force Vent unit

Standard clutch brake modules with IEC flanges can be fitted between motor and gearhead. Refer to page 183 for more details).

Variable speed packages are available, either integrated inverter-motors or mechanical disc variators. Refer to page 184 and 393 for more details.

Backstop modules are available formotor frame sizes 100 to 200. Refer to page 305 for more details.

Brake motors please refer to age 181.

Force vent please refer to page 182.

For any of these combinations please contact your local Authorised Distributor.

Fenner®

SERIES C

HELICAL WORM

Modern design techniques enable the Fenner® Series C Helical Worm gear unit to out perform any other gearbox in terms of lowest cost /Nm.

- Drives up to 45kW
- Energy efficient right angled drive
- Versatile mounting
- Ratios from 8:1 to 13,500:1 off the shelf
- Dimensionally interchangeable with the market leaders
- Accepts standard IEC motors without modification
- ATEX certification available

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?**
electrical supply available
- **If motorised:**
any special motor features required (brake, thermistors, flameproof etc.)
- **If non-motorised:**
type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Foot, flange or shaft mounted?**
if shaft mounted, machine shaft diameter/length
if foot mounted, is an output shaft coupling required?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

SERIES C

(a) Absorbed Power

Calculate absorbed power (kW) to drive designated machine P.

(b) Absorbed Torque

Determine the absorbed torque and speed required by the driven machine. If the required output torque is not known it can be calculated using the following formula:

$$T = \frac{P \times 9550}{n_2}$$

T = required output torque (Nm)
 P = absorbed power (kW)
 n₂ = machine speed (rev/min)

(c) Service Factor

From Table 1 select the Mechanical Service Factor (**Fm**) applicable to the drive. If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor **Fm** by Factor **Fs** from table 2.

(d) Motor Power

Refer to the selection tables and choose closest motor power above the required absorbed power then find the nearest available output speed to that required. Ensure it has sufficient output torque, if not, move to next motor size.

(e) Unit Selection

At the selected output speed read downwards to the first unit with an output torque in excess of the absorbed torque from step (b). Read across to column 3 and check if the service factor exceeds the value from step (c). If maximum service factor equals or exceeds the value from step (c) read across to unit selection column, this gives the relevant product code. If the value from step (c) exceeds the service factor read down to the first service factor to equal or exceed the value from step (c) and read across to the unit selection column.

(f) Overhung Loads

If the unit is to be fitted with an output shaft and an indirect drive attached to the shaft, calculate the overhung load value using the formula on page 234 and compare this value with the maximum allowable value given in column 5 of the selection tables. If the value exceeds the maximum allowed, then either re-design the indirect drive or select a larger unit capable of supporting the overhung load.

(g) Shaft Mounted

From the relevant dimension pages determine the required machine shaft diameter. There are several bore options on most of the range.

NOTE:

- (i) The output speeds in the selection table assume nominal motor speeds. In order to determine the exact output speeds of the unit refer to the motor details on page 307.
- (ii) For exact ratios of series C units refer to page 232.

EXAMPLE

A Series C motorised shaft mounted gear unit is required for a uniformly loaded conveyor which absorbs 5.7 kW at 46 rpm when running for up to 16 hours/day during which it stops and starts 8 times.

- (a) Absorbed power is 5.7kW
- (b) Torque = $\frac{5.7 \times 9550}{46} = 1183 \text{ Nm}$
- (c) From table 1 service factor is 1.25. The machine stops and starts only 8 times a day therefore an additional stop/start factor is not required.

- (d) Closest motor power above 5.7kW is 7.5kW and the nearest available speed is 46 rev/min.
- (e) First unit with output torque in excess of 1183 Nm is capable of 1424 Nm and has a maximum service factor of 1.37. Service factor exceeds 1.25 from step (c) therefore read across to unit selection column for product code, 875A1156.
- (f) From column 5 the overhung load capacity is 37565 N. If an indirect drive is fitted calculate the load using the formula on page 234 and compare it with this value.
- (g) Shaft diameter needs to be 70 mm. So the standard bore option can be used.

TABLE 1 - MECHANICAL SERVICE FACTOR (Fm)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25
Moderate Shock Loads Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Pumps – reciprocating with 3 or more cylinders Pump and Paper Making Machinery Rubber Mixers and Calendars Screens – rotary Textile Machinery	1.00	1.25	1.50
Heavy Shock Loads Brick Presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Pumps – reciprocating, 1 or 2 cylinders Rubber Masticators Screens – vibrating	1.50	1.75	2.00

* See page 398 for notes on reducing service factors

TABLE 2 - STARTING SERVICE FACTOR FS

Factor Fs	Start/stops per hour					
	Up to 1	5	10	40	60	>200
	1.00	1.03	1.06	1.10	1.15	1.20

For ATEX certified gear units please consult your local Authorised Distributor.

Series C

Highly Efficient, Versatile Compact Solutions

- Energy efficient right angled drive
- Dimensionally interchangeable with market leaders
- Versatile mounting
- Oil tight gearhead enables motor removal without modification
- Accepts standard IEC motors without modification
- Ratios from 8:1 to 13,500:1

FEET CODE

Unit Size	Product Code
870	870A9500
871	871A9500

Unit Size	Product Code
872	872A9500
873	873A9500

Units are fitted with output bearings of ample proportions to cater for the radial and thrust loads imposed by the worm gear, leaving sufficient capacity for taking overhung loads.

The calculated overhung load should be compared with the value in the selection tables.

These values may be exceeded at lower input speeds or if limited bearing lives are acceptable. In cases where higher overhung load capacities are necessary consult your Authorised Distributor, quoting details of power, speed, direction of gearbox rotation, angle of application of load, distance of load application from gearbox and acceptable bearing life.

Series C	
Unit Size	A mm
870	17.5
871	23.0
872	30.0
873	31.5
874	38.0
875	60.0
876	67.5
877	85.0

To determine the overhung load when a sprocket, gear or 'V' pulley is fitted to the output shaft, one of the following formulae may be used in the absence of accurate information.

(1) Calculation on a basis of Torque

$$\text{Overhung load (N)} = \frac{T \times 1000 \times K}{r}$$

(2) Calculation on a basis of Power

$$\text{Overhung load (N)} = \frac{\text{kW} \times 9550 \times 1000 \times K}{n \times r}$$

Where:

- T = Absorbed torque at shaft in Nm.
 kW = Absorbed power at shaft (kW).
 r = Pitch radius of sprocket, gear or 'V' pulley in mm.
 n = Rev/min output shaft.
 K = Application factor -
 1.00 for a sprocket
 1.25 for a gear or timing pulley
 1.50 for a 'V' pulley

Overhung loads may be reduced by one of the following methods:

- (1) Increase the diameter of the sprocket, gear or pulley within reasonable limits.
- (2) Mount the sprocket, gear or pulley on a separate shaft, supported with bearings and couple to the output shaft by means of a Fenner shaft coupling.
- (3) Use a special extended output shaft and support the free end with an outrigger bearing.

ORDERING INSTRUCTIONS

All Series C motorised worm gear units fitted with a standard electric motor are identified by an eight digit code taken from the selection tables.

If an alternative motor type is required a ninth digit is added to the standard code.

FIRST THREE DIGITS:

Gearmotor type and size

FOURTH DIGIT: Type of assembly required.

A: Geared motor (standard bore)

Z: Geared motor (alternate bore)

D: Reducer (standard bore)

Y: Reducer (alternate bore)

G: Motor ready (standard bore)

X: Motor ready (alternate bore)

FIFTH AND SIXTH DIGIT: Ratio Code.

Exact ratios can be found on page 232.

SEVENTH/EIGHTH DIGIT: Type of drive code

1. Motorised units - use complete code from selection tables.
2. Input Reducer assembly - use **00**.
3. Motor ready units are supplied to fit standard IEC motor insert frame code from table opposite.

NINTH DIGIT: Type of motor variant

Use eight digit code obtained from selection tables for required motor power and speed and then add the relevant letter code from table opposite of the motor variant required.

CODE	ADDITIONAL FEATURE
A	Anti-condensation heaters fitted
B	Backstop Fitted
E	Fitted with Encoder
L	Clutch/brake unit
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer to Original Quote - Special
S	Single Phase motor
W	WIMES Spec motor (Water Industry)
X	Fitted with Variator
Z	Fitted with Force Vent unit

ELECTRIC MOTOR VARIANTS

All variants of standard IEC motors can be fitted to Fenner Gearmotors, Series C is also capable of accepting NEMA motor variants as well. Examples of some of the variants and their ninth digit code letter are in the table opposite.

Standard clutch brake modules with IEC flanges can be fitted between motor and gearhead.

Variable speed packages are available, either belt variators or mechanical disc variators.

Backstop modules are available for motor frame sizes 100 to 200.

For any of these combinations please contact your local Authorised Distributor.

Code	Frame	Flange
63C	63	B14
63D	63	B5
71C	71	B14
71D	71	B5
80C	80	B14
80D	80	B5
90C	90	B14
90D	90	B5
10C	100/112	B14
10D	100/112	B5
13D	132	B5
16D	160	B5
18D	180	B5
20D	200	B5
22D	225	B5
25D	250	B5

Satisfactory performance depends on proper installation, lubrication and maintenance. All instructions given in the installation leaflet must be followed carefully.

Shaft Mounting

Ensure that the shaft on to which the gear unit is to be mounted and the gear unit bore are clean and free from burrs.

Liberal smear the shaft and bore with lubricants to aid assembly and prevent fretting corrosion. Slide the unit on to the driven shaft, fit side fitting key. **DO NOT USE TAPER OR TOP FITTING KEY.**

LUBRICANT TYPE TEMPERATURE RANGE

ISO Viscosity	Ambient Temperature °C		
	-30° to 20°C	0°C to 35°C	20°C to 50°C
Synthetic Oil 1	220	320	460
Synthetic Oil 2	220	220	320

Synthetic Oil 1 = Polyglycol based
 Synthetic Oil 2 = Polyalphaolefin based.
 We recommend the use of a Polyglycol synthetic oil - see the note below regarding power ratings.

RECOMMENDED LUBRICANTS

Supplier	Lubricant
	POLYGLYCOL BASED SYNTHETIC
BP	ENERSYN SG-XP
CASTROL	ALPHASYN PG
ESSO	GLYCOLUBE
MOBIL	GLYGOYLE
SHELL	TIVELA
TEXACO	SYNLUBE CLP

Use the ISO viscous grades shown in the table above.
 The catalogue ratings are based on the Polyglycol range of synthetic oils recommended in the above table.
 The use of mineral or other types of oil will require a gearbox derate. Please consult your local authorised distributor.

876	17	11	17	8.3	12	18	25	17	-	-	-	-	-	-	-	-
877	21	17	26	14	21	31	42	28	-	-	-	-	-	-	-	-

Foot Mounting

Mount the unit securely to a rigid structure. Fit the output extension shaft as required. Use flexible couplings such as Fenflex for shaft to shaft connections and ensure that shaft misalignment is within the coupling's capacity. When a pulley or sprocket is fitted to either shaft, mount it as close as possible to the gearbox.

When fitting or removing drive components do not hammer on shaft as this will damage the bearings, Fenner Taper Lock bushes permit easy fixing and dismantling without undue force.

LUBRICATION

Sizes 870 to 873 are pre-filled for mounting position B3 with synthetic lubricant. Other mounting positions **must be specified without oil**. Before running they should be filled with an appropriate amount of the correct lubricant shown in the table, dependent on the mounting position, see below. Oil capacities are only approximate and units should be filled until oil escapes from the level plug hole.

WARNING: Do not overfill as excess lubricant may cause overheating and leakage.

Oil Changes

Sizes 870 and 871 are lubricated for life except when the units are required to work in an explosive atmosphere. (94/9/EC Atex 100a Group II category 2 zones 1 & 21 & category 3 zones 2 & 22). See separate leaflet for recommendations. All other sizes will require an oil change depending on the unit operating temperature. Initial fill of oil should be changed in a new gear unit after 1000 hours operation or one year or half the life in the table below whichever is the soonest.

Unit Op Temp °C	Renewal Period (Hours)	
	Mineral Oil	Synthetic Oil
65 or less	17000 or 3 Yrs	26000 or 3 Yrs
70	12000 or 3 Yrs	26000 or 3 Yrs
75	8500 or 3 Yrs	22000 or 3 Yrs
80	6000 or 2 Yrs	15000 or 3 Yrs
85	4200 or 17 Mths	10500 or 3 Yrs
90	3000 or 12 Mths	7500 or 2.5 Yrs
95	2100 or 8 Mths	6000 or 2 Yrs
100	1500 or 6 Mths	4500 or 18 Mths

BREATHERS/MOUNTING POSITIONS

Sizes 870 to 873 are supplied for operation without breathers.

Sizes 874 to 877 are supplied for operation with breather but are despatched without oil. It is essential that when the unit is in its operating position the relevant blanking plug is removed and replaced by the breather plug (supplied) in the position indicated on the installation leaflet.

MOUNTING POSITIONS

Standard Floor Mounting B3

Left Hand Wall Mounting B7 †

Right Hand Wall Mounting B6 † *

Standard Ceiling Mounting B8

Wall Mounting Shaft Down (V5)

Wall Mounting Shaft Up (V6)

† Gear units for use in mounting positions B6 & B7 should only be selected with overall ratios greater than or equal to those shown in the table below.

* Mounting position B6 is not recommended for geared motors. Consult your local authorised distributor.

Unit Size	Input Speed (rpm)			
	1000	1500	1800	>1800

Plug positions apply for sizes 862 and larger. ○ Ventilator/Filling Position ● Level Position ● Drain Position

Fenner®

SERIES F

PARALLEL SHAFT

The new Fenner Series F geared motor range is primarily designed as a compact shaft mounted unit incorporating a integral torque reaction bracket.

- New range now has 11 sizes
- Input power up to 110kW
- Output torque up to 16,500 Nm
- Ratios from 5:1 to 350:1 available from stock
- Dimensionally interchangeable with market leaders
- Accepts standard IEC motors
- ATEX certification available 

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?**
electrical supply available
- **If motorised:**
any special motor features required (brake, thermistors, flameproof etc.)
- **If non-motorised:**
type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Shaft mounting or flange mounted?**
if shaft mounted, machine shaft diameter/length
if flange mounted, is an output shaft and coupling required?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

MOTORISED UNITS SELECTION PROCEDURE

(a) Service Factor

From Table 1 select the Mechanical Service Factor (Fm) applicable to the drive. If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor Fm by Factor Fs from table 2 below.

(b) Motor Power

Refer to the selection tables on pages 240 to 253 and choose a motor power equal to or in excess of that required, if the motor power is not known then from the formula below determine the power requirements of the driven machine and select a motor power in excess of the calculated machine absorbed power.

$$P_A = \frac{T \times n}{9550}$$

- PA = machine absorbed power (kW)
- T = machine absorbed torque (Nm)
- n = machine speed (rev/min)

If the absorbed power is given in kW use the formula below to check the selected unit will give sufficient output torque.

Output torque values for Fenner Series F Gear Motor units are given in column two of the selection tables.

$$T = \frac{P_A \times 9550}{n}$$

- T = machine absorbed torque (Nm)
- PA = machine absorbed power (kW)
- n = machine speed (rev/min)

(c) Unit Selection

Refer to the selection tables on page 240 to 253 and choose the closest above that calculated in step (b). Then read down the column headed "Nominal Output" until a speed equal to or near to the required speed is found. On this line read across to the service factor column and check that the service factor exceeds the value from step (a). If the service factor is either lower or much higher than that required check the speeds at each side of the required speed to see if a more suitable unit and factor can be found.

(d) Overhung Loads

If the unit is to be fitted with an output shaft and an indirect drive attached to the shaft, calculate the overhung load value using the formula on page 268 and compare this value with the maximum allowable value given in column 5 of the selection tables.

If the value exceeds the maximum allowed, then either re-design the indirect drive or select a larger unit capable of supporting the overhung load.

(e) Shaft Mounted

If the unit is to be shaft mounted determine the relevant machine shaft size from the dimension tables on page 254. Torque bush dimensions can be found on page 267.

SELECTION EXAMPLE

A Series F shaft mounted gearbox is required to drive a non-uniformly loaded conveyor, which absorbs 2kW at 48 rpm and operates for up to 16 hours per day. The conveyor stops and starts on average 6 times a day. Specify the shaft diameter required to fit the unit selected, a torque bush is also required please specify the relevant product code.

(a) Service Factor

From table 1 a non-uniformly loaded conveyor is classed as a moderately loaded machine and when running for up to 16 hours per day has a service factor of 1.5. The machine stops and starts only 6 times a day therefore an additional stop/start factor is not required.

(b) Motor Power

The absorbed power is given as 2kW therefore use the next largest standard motor power above this which is 2.2kW.

To determine the required torque use the absorbed power (kW) and the machine shaft speed in the formula given.

Therefore the machine absorbed Torque

$$T = \frac{2 \times 9550}{48} = 398 \text{ Nm}$$

(c) Unit Selection

The nearest standard motor power above 2 kW is 2.2 kW therefore we go to the 2.2kW

geared motor selections on page 245. Reading down the column headed nominal output it is found that there are 5 units listed at 48 rpm, at the first one of these read across to service factor column, it can be seen that the unit size 781A1445 has a service factor of 1.31, which does not exceed the 1.5 required service factor therefore read down the table to a factor that equals or exceeds this.

It can be seen that the 783A1245 is the first unit with a factor above 1.5, the last two digits of the product code (45) indicate that this unit is fitted with a 6 pole motor, it is usually more economical to select a 4 pole version if possible. Therefore the next unit down 783A1736 would be selected as this is the same size gearbox (783), and has a service factor of 1.58 exceeding the required value of 1.5. The output torque for this selection is 422Nm which exceeds the required 398Nm, therefore is suitable for the application.

(d) Overhung Loads

The gearbox is to be shaft mounted therefore no overhung loads present.

(e) Shaft Mounted

The unit is to be shaft mounted, referring to page 254 we see that the hub bore size is 40mm. From page 268 the torque bush to suit the size 783 unit selected has a product code of 881A9600.

TABLE 1 - MECHANICAL SERVICE FACTOR (Fm)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25

Motorised Selection

Double reduction units are shown in normal typeface **Bold typeface indicates triple reduction units**
See page 272 for fourth digit of code and page 307 for motor details.

**NON-MOTORISED UNITS
SELECTION PROCEDURE**

(a) Service Factor

From Table 1 select the Mechanical Service Factor (**Fm**) applicable to the drive. If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor **Fm** by Factor **Fs** from table 2.

(b) Motor Power

Determine either the required torque (Nm) or the absorbed power (kW) required by the machine. The required Torque can be calculated using the following formula:

$$T = \frac{P \times 9550}{n_2}$$

T = required output torque (Nm)

P = absorbed power (kW)

n₂ = machine speed (rev/min)

(c) Design Power

Multiply either the required torque (Nm) or the power (kW) by the service factor determined in (a).

(d) Ratio Required

Divide the input shaft speed by the required output shaft speed to determine the gear ratio.

(e) Unit Selection

In the selection pages: 256 to 262 refer to column 1 for the nominal gear ratio closest to the value determined in step (d).

The Fenner gear ratio code is given in column 2. These are the fifth & sixth digits used in the eight digit ordering code and are included for easy reference when the unit size has been selected.

Check in column 3 for the nearest input shaft speed, then read across the table at this speed until a unit is found with either an output torque or input power that equals or exceeds the design power value determined in step (c) above. Column 4 gives the approximate output shaft speed for the selected speed and ratio combination.

(f) Overhung Loads

If an indirect drive is fitted to either the input shaft or output shaft see page 268 for more information.

TABLE 1 - MECHANICAL SERVICE FACTOR (Fm)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25
Moderate Shock Loads Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Pumps – reciprocating with 3 or more cylinders Pump and Paper Making Machinery Rubber Mixers and Calendars Screens – rotary Textile Machinery	1.00	1.25	1.50
Heavy Shock Loads Brick Presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Pumps – reciprocating, 1 or 2 cylinders Rubber Masticators Screens – vibrating	1.50	1.75	2.00

* See page 398 for notes on reducing service factors

TABLE 2 - STARTING SERVICE FACTOR Fs

Factor Fs	Start/stops per hour					
	Up to 1	5	10	40	60	>200
	1.00	1.03	1.06	1.10	1.15	1.20

For accessory codes of 789 and 790 units, please consult your local Authorised distributor.

ALLOWABLE OVERHUNG LOADS

Units are fitted with input and output bearings of ample proportions to cater for the radial and thrust loads imposed by the gear loads, leaving sufficient capacity for taking overhung loads. The calculated overhung load should be compared with the value in the selection tables.

These values may be exceeded at lower input speeds or if limited bearing lives are acceptable. In cases where higher overhung load capacities are necessary consult your distributor, quoting details of power, speed, direction of gearbox rotation, angle of application of load, distance of load application from gearbox and acceptable bearing life.

Permissible overhung loads vary according to the direction of rotation. The values tabulated are for the most unfavourable direction with the unit transmitting full rated power and the load applied midway along the shaft extension. Hence they can sometimes be increased for a more favourable direction of rotation, or if the power transmitted is less than the rated capacity of the gear unit, or if the load is applied nearer to the gear unit case. Refer to your Distributor for further details.

In any event, the sprocket, gear etc. should be positioned as close as possible to the gear unit case in order to reduce bearing loads and shaft stresses, and to prolong life. All units will accept a 100% momentary overload on stated capacities.

To determine the overhung load when a sprocket, gear or 'V' pulley is fitted to either shaft, one of the following formulae may be used in the absence of accurate information.

(1) Calculation on a basis of Torque

$$\text{Overhung load (N)} = \frac{T \times 1000 \times K}{r}$$

(2) Calculation on a basis of Power

$$\text{Overhung load (N)} = \frac{kW \times 9550 \times 1000 \times K}{n \times r}$$

Where:

- T = Absorbed torque at shaft in Nm.
- kW = Absorbed power (kW).
- r = Pitch radius of sprocket, gear or 'V' pulley in mm.
- n = Rev/min of shaft.
- K = Application factor -
 - 1.00 for a sprocket
 - 1.25 for a gear or timing pulley
 - 1.50 for a 'V' pulley

Overhung loads may be reduced by one of the following methods:

1. Increase the diameter of the sprocket, gear or pulley within reasonable limits.
2. Mount the sprocket, gear or pulley on a separate shaft, supported on it's own bearings and couple to gearbox output shaft by means of a Fenner shaft coupling.

Axial Thrust Capacities (N)

No check or calculation is required for axial loads (Fa) towards or away from the unit up to 50% of the permissible overhung load. If the axial thrust exceeds these values or if there is a combination of axial thrust loads and overhung loads please refer to your local Authorised Distributor.

SHAFT MOUNTING

Ensure that the shaft on to which the gear unit is to be mounted and the gear unit bore are clean and free from burrs. Liberally smear the shaft and bore with lubricants to aid assembly and prevent fretting corrosion. Slide the unit on to the driven shaft and secure unit onto the shaft using chosen method. Fit side fitting key. **DO NOT USE TAPER OR TOP FITTING KEY.**

FLANGE MOUNTING

The Fenner Series F Mk II is designed primarily as a shaft mounted gearbox. However, it can be supplied with a single or double output shaft and a mounting flange if required.

LUBRICATION

Sizes 780 to 784 are pre-filled for mounting position B3 with a quantity of EP mineral oil (Shell Omala 320). However, if the unit is supplied without lubricant then the oil quantity is obtained from the table at the bottom of page 271.

Other mounting positions must be specified on order. Sizes 785 to 790 are supplied without oil. Before running they should be filled with an appropriate amount of the correct lubricant shown in the table, dependent on the mounting position, see chart. **WARNING:** Do not over fill as excess lubricant may cause overheating and leakage.

For Lubrication quantity, recommended grades and viscosity tables see table opposite.

OIL CHANGES

Sizes 780 to 783 are lubricated for life except when the units are required to work in an explosive atmosphere (94/9/EC Atex 100a Group II category 2 zones 1 & 21 & category 3 zones 2 & 22) See separate leaflet for recommendations. All other sizes will require an oil change depending on the unit operating temperature. Initial fill of oil should be changed in a new gear unit after 1000 hours operation or one year or half the life in the table below whichever is the soonest.

BREATHERS/MOUNTING POSITIONS

All sizes of Series F are supplied for operation without a breather. On sizes 785 and above the unit should be filled to the recommended level for operating position being used and the blanking plug replaced in the filling position indicated below.

MOTOR CONNECTIONS TO MAINS

Connection of the electric motor to the mains supply should be made by a qualified person.

The current rating of the motor will be identified on the motor plate and correct sizing of the cables to electrical regulations is essential.

STARTING UP

Prior to starting up the following procedure should be followed

1. Check Oil level (784 and above) top up if necessary
2. Ensure all safety devices are in place (i.e. guards fitted)
3. Remove any safety devices fitted to prevent machine rotation

Starting up should be performed or supervised by suitably qualified personnel.

MOUNTING POSITIONS - SIZES 780-788

MOUNTING POSITIONS - SIZES 789-790

V6	17.2	17.4	25	25	43	43	30	29	50	48

Oil quantities are approximate, fill gearbox until oil escapes from level plug hole. Do not over fill as excess lubricant may cause overheating and leakage.

All Fenner Series F geared motors are identified by a product code number; this can consist of an eight or nine digit number depending on the type of motor fitted or the style of unit.

The basic 8 digit code giving the unit type, size, ratio and motor power should be taken from the selection tables. A break down of the coding system for the basic unit and the other options is given below.

If a different motor is required a ninth digit is usually added to the end of the normal 8 digit code, see the table below.

These codes should be included on all enquiries, correspondence and orders.

FIRST THREE DIGITS:

Unit Size – For series F codes are 780 to 790

FOURTH DIGIT:

Mounting Code

- A** Motorised with Standard Hollow Bore
- D** Input Reducer Assembly with Standard Hollow Bore
- G** Standard Hollow Bore unmotorised (ready to fit motor)

FIFTH AND SIXTH DIGIT:

Gear Ratio Code. (For exact ratio and codes see page 264).

SEVENTH/EIGHTH DIGITS:

Input drive code

1. Motorised units - use complete code from selection tables with if applicable, additional ninth digit for motor type.
2. Input Reducer assembly - use **00**.
3. Unmotorised units ready an IEC motor to be fitted - use the three digit code as shown in the table below.

Code	Frame	Flange
63C	63	B14
63D	63	B5
71C	71	B14
71D	71	B5
80C	80	B14
80D	80	B5
90C	90	B14
90D	90	B5
10C	100/112	B14
10D	100/112	B5
13D	132	B5
16D	160	B5
18D	180	B5
20D	200	B5
22D	225	B5
25D	250	B5

NINTH DIGIT:

Type of motor variant

Use eight digit code obtained from selection tables for required motor power and speed and then add the relevant letter code from table below of the motor variant required.

Code	Additional Feature
A	Anti-condensation heaters fitted
B	Backstop Fitted
E	Fitted with Encoder
L	Clutch/Brake Unit
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer to Original Quote - Special
S	Single Phase motor
T	Fitted with Thermistors
X	Fitted with Variator
Z	Fitted with Force Vent unit

Fenner®

SERIES K

BEVEL HELICAL

The Fenner® Series K incorporates all the core design features in a highly efficient yet flexible bevel helical drive.

- Drives up to 90kW
- Highly efficient right angled drive
- Ratios from 8:1 to 7250:1 available from stock
- Dimensionally interchangeable with the market leaders
- Accepts standard IEC motors without modification
- ATEX certification available 

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?**
electrical supply available
- **If motorised:**
any special motor features required (brake, thermistors, flameproof etc.)
- **If non-motorised:**
type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Shaft mounting or foot mounted?**
if shaft mounted, machine shaft diameter/length
if foot mounted, is an output shaft coupling required?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

SELECTION PROCEDURE

(a) Service Factor

From Table 1 select the Mechanical Service Factor (**Fm**) applicable to the drive.

If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor **Fm** by Factor **Fs** from table 2.

(b) Motor Power

Refer to the selection tables on pages 276 to 283 and choose a motor power equal to or in excess of that required, if the motor power is not known then from the formula below determine the power requirements of the driven machine and select a motor power in excess of the calculated machine absorbed power.

$$P_A = \frac{T \times n}{9550}$$

P_A = Machine absorbed power (kW)

T = Machine absorbed torque (Nm)

n = Machine speed (Rev/Min)

(c) Unit Selection

Refer to the selection tables on page 276 to 283 and choose a motor power equal to or in excess of that calculated in step (b). Then read down the column headed "Nominal Output" until a speed equal to or near to the required speed is found. On this line read across to the service factor column and check that the service factor exceeds the value from step (a). If the service factor is either lower or much higher than that required check the speeds at each side of the required speed to see if a more suitable service factor can be found.

(d) Overhung Loads

If the unit is to be fitted with an output shaft and an indirect drive attached to the shaft, calculate the overhung load value using the formula on page 297 and compare this value with the maximum allowable value given in column 5 of the selection tables. If the value exceeds the maximum allowed, then either re-design the indirect drive or select a larger unit capable of supporting the overhung load.

(e) Shaft mounted

If the unit is to be shaft mounted determine the relevant machine shaft size from the dimension tables on page 284. Torque arm dimensions can be found on page 298.

SELECTION EXAMPLE

A series K shaft mounted gearbox is required to drive a variable density mixer, which absorbs 450 Nm at 37 rpm and operates for up to 10 hours per day. The mixer stops and starts on average 4 times a day. Specify the shaft diameter required to fit the unit selected, a torque arm bracket is also required please specify the relevant product code.

(a) Service Factor

From table 1 a variable density mixer is classed as a moderately loaded machine and when running for up to 10 hours per day requires a service factor of 1.25.

The machine stops and starts only 4 times a day therefore an additional stop/start factor is not required.

(b) Motor Power

To determine the required motor power use the absorbed torque and the machine shaft speed in the formula given. Then use the next largest standard motor power above this.

Therefore the absorbed Power P_A =

$$\frac{450 \times 37}{9550} = 1.743 \text{ kW}$$

(c) Unit Selection

The nearest standard motor power above 1.743 kW is 2.2 kW therefore we go to the 2.2kW geared motor selections on page 278.

Reading down the column headed nominal output it is found that there are 2 units listed at 37 rpm, at the first one of these read across to maximum service factor column, it can be seen that the unit size 893A1436 has a service factor of 1.51.

This exceeds the 1.25 Service factor required and therefore is suitable for the application.

(d) Overhung Loads

The gearbox is to be shaft mounted therefore there are no overhung loads present.

(e) Shaft Mounted

The unit is to be shaft mounted, referring to page 284 we see that the hub bore size is 40 mm.

From page 298 the torque arm bracket to suit the size 893 unit selected has a product code of 893A9600.

TABLE 1 - MECHANICAL SERVICE FACTOR (Fm)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25

SELECTION OF NON-MOTORISED REDUCER UNITS

(a) Service Factor

From Table 1 select the Mechanical Service Factor (**F_m**) applicable to the drive.

If the unit is to be subjected to frequent stop/starts in excess of 10 times per day then multiply factor **F_m** by Factor **F_s** from table 2.

(b) Power Required

Determine either the absorbed torque (Nm) or the input power (kW) required by the machine.

The absorbed Torque can be calculated using the following formula:

$$T = \frac{P \times 9550}{n_2}$$

T = required output torque (Nm)

P = absorbed power (kW)

n₂ = machine speed (Rev/Min)

(c) Design Power

Multiply either the absorbed torque (Nm) or the power (kW) by the service factor determined in (a)

(d) Ratio Required

Divide the input shaft speed by the required output shaft speed to determine the gear ratio.

(e) Unit Selection

In the selection pages: 287 to 293 refer to the gear ratio closest to the value determined in step (d).

Check in column 1 for the nearest input shaft speed, then read across the table at this speed until a unit is found with either an output torque or input power that equals or exceeds the design power value determined in step (c) above. Column 3 gives the approximate output shaft speed for the selected speed and ratio combination.

TABLE 1 - MECHANICAL SERVICE FACTOR (F_m)

Types of Driven Machine	Operational hours		
	Under 3	3 to 10	Over 10
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.25
Moderate Shock Loads Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Pumps – reciprocating with 3 or more cylinders Pump and Paper Making Machinery Rubber Mixers and Calendars Screens – rotary Textile Machinery	1.00	1.25	1.50
Heavy Shock Loads Brick Presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Pumps – reciprocating, 1 or 2 cylinders Rubber Masticators Screens – vibrating	1.50	1.75	2.00

* See page 398 for notes on reducing service factors

TABLE 2 - STARTING SERVICE FACTOR (F_s)

Factor F _s	Start/stops per hour					
	Up to 1	5	10	40	60	>200
Factor F _s	1.00	1.03	1.06	1.10	1.15	1.20

For ATEX certified gear units please consult your local Authorised Distributor.

Bold print denotes quintuple reduction gearbox. Higher ratios available—consult your Authorised Distributor

Overhung Load Capacities

ALLOWABLE OVERHUNG LOADS

Units are fitted with input and output bearings of ample proportions to cater for the radial and thrust loads imposed by the gear loads, leaving sufficient capacity for taking overhung loads.

The calculated overhung load should be compared with the value in the selection tables.

These values may be exceeded at lower input speeds or if limited bearing lives are acceptable. In cases where higher overhung load capacities are necessary consult your distributor, quoting details of power, speed, direction of gearbox rotation, angle of application of load, distance of load application from gearbox and acceptable bearing life.

Permissible overhung loads vary according to the direction of rotation. The values tabulated are for the most unfavourable direction with the unit transmitting full rated power and the load applied midway along the shaft extension. Hence they can sometimes be increased for a more favourable direction of rotation, or if the power transmitted is less than the rated capacity of the gear unit, or if the load is applied nearer to the gear unit case. Refer to your Distributor for further details. In any event, the sprocket, gear etc. should be positioned as close as possible to the gear unit case in order to reduce bearing loads and shaft stresses, and to prolong life.

All units will accept a 100% momentary overload on stated capacities.

To determine the overhung load when a sprocket, gear or 'V' pulley is fitted to the output shaft, one or the following formulae may be used in the absence of accurate information.

(1) Calculation on a basis of Torque

$$\text{Overhung load (N)} = \frac{T \times 1000 \times K}{r}$$

(2) Calculation on a basis of Power

$$\text{Overhung load (N)} = \frac{\text{kW} \times 9550 \times 1000 \times K}{n \times r}$$

Where:

- T = Absorbed torque at shaft in Nm.
- kW = Absorbed power in kW.
- r = Pitch radius of sprocket, gear or 'V' pulley in mm.
- n = Rev/min of shaft.
- K = Application factor -
 1.00 for a sprocket
 1.25 for a gear or timing pulley
 1.50 for a 'V' pulley

Overhung loads may be reduced by one of the following methods:

- (1) Increase the diameter of the sprocket, gear or pulley within reasonable limits.

(2) Mount the sprocket, gear or pulley on a separate shaft, supported on its own bearings and couple to the gear unit output shaft by means of a Fenner shaft coupling.

(3) Use a special extended output shaft and support the free end with an outrigger bearing.

Axial Thrust Capacities (N)

No check or calculation is required for axial loads towards or away from the unit up to 50% of the permissible overhung load. If the axial thrust exceeds these values or if there is a combination of axial thrust loads and overhung loads please refer to your local Authorised Distributor.

NOTES: It is recommended that the torque arm is fitted on the side of the unit adjacent to the driven machine. The use of a fitted bolt is recommended.

SHRINK DISK

The Fenner Series K gear unit can be supplied with a 'shrink disc' device located on the hollow output shaft to provide a positive outer locking connection between gear unit and driven shaft. The 'shrink disc' is a friction device, without keys, which exerts an external clamping force on the hollow output shaft, thus establishing a mechanical shrink fit between the gear unit hollow shaft and driven shaft. 'Shrink disc' capacities have ample margins in dealing with transmitted torques and external loading imposed on gear units.

Working Principle

The 'shrink disc' consists of a locking collar, a tapered inner ring and locking screws. By tightening the locking screws, the locking collar and tapered inner ring are pulled together, exerting radial forces on the inner ring, thus creating a positive friction connection between hollow shaft and driven shaft.

As the tapered surfaces of the locking collar and inner ring are lubricated with Molykote 321R or similar and the taper angle is not self locking, the locking collar will not seize on the inner ring and can be released easily when removal is necessary.

When the shrink disc is clamped in position the high contact pressures between tapered surfaces and screw heads and their seatings ensure hermetic sealing and eliminate the possibility of fretting corrosion.

Please consult your local Authorised Distributor for delivery details.

Satisfactory performance depends on proper installation, lubrication and maintenance. All instructions given in the installation leaflet must be followed carefully.

Shaft Mounting

Ensure that the shaft on to which the gear unit is to be mounted and the gear unit bore are clean and free from burrs.

Liberally smear the shaft and bore with lubricants to aid assembly and prevent fretting corrosion. Slide the unit on to the driven shaft. Fit side fitting key. **DO NOT USE TAPER OR TOP FITTING KEY.**

Foot Mounting

Mount the unit securely to a rigid structure. Fit the output extension shaft as required. Use flexible couplings such as Fenaflex for shaft to shaft connections and ensure that shaft misalignment is within the coupling's capacity. When a pulley or sprocket is fitted to either shaft, mount it as close as possible to the gearcase.

When fitting or removing drive components do not hammer on shaft as this will damage the bearings, Fenner Taper Lock bushes permit easy fixing and dismantling without undue force.

LUBRICATION

Sizes 890 to 893 will be supplied with a quantity of EP mineral oil (Shell Omala 320) for mounting position B3. Other mountings must be specified on order. However if , as requested, the unit is supplied without lubricant then the oil quantity is obtained from Tables 1 & 2. Sizes 894 to 898 are supplied without oil. Before running they should be filled with an appropriate amount

of the correct lubricant shown in tables 1 & 2, dependent on the mounting position, see below.

WARNING Do not overfill as excess lubricant may cause overheating and leakage.

Oil Changes

Sizes 890, 891 and 892 are lubricated for life except when the units are required to work in an explosive atmosphere. (94/9/EC Atex 100a Group II category 2 zones 1 & 21 & category 3 zones 2 & 22). See separate leaflet for recommendations. All other sizes will require an oil change depending on the unit operating temperature. Initial fill of oil should be changed in a new gear unit after 1000 hours operation or one year or half the life in the table below whichever is the soonest.

Unit Op Temp °C	Renewal Period (Hours)	
	Mineral Oil	Synthetic Oil
75 or less	17000 or 3 yrs	26000 or 3 yrs
80	12000 or 3 yrs	26000 or 3 yrs
85	8500 or 3 yrs	21000 or 3 yrs
90	6000 or 2 yrs	15000 or 3 yrs
95	4200 or 17 mths	10500 or 3 yrs
100	3000 or 12 mths	7500 or 2.5 yrs
105	2100 or 8 mths	6200 or 2 yrs
110	1500 or 6 mths	2100 or 18 mths

Temperature Limitations

The standard lubricant is suitable for operation in ambient temperatures of 0 to 35°C, outside of this consult your local Authorised Distributor.

BREATHERS/MOUNTING POSITIONS

Sizes 890,891 & 892 are supplied for operation without breathers.

Size 893 is supplied for operation with a breather but to prevent leakage during transit this unit is fitted with blanking plugs. It is essential that when the unit is in its operating position the relevant blanking plug is removed and replaced by the breather plug (supplied) in the position indicated on the installation leaflet.

Sizes 894 to 898 are supplied for operation with a breather but are despatched without oil.

It is essential that when the unit is in its operating position the relevant blanking plug is removed and replaced by the breather plug (supplied) in the position indicated on the installation leaflet.

STARTING UP

Prior to starting up the following procedure should be followed

1. Ensure Ventilator is fitted (size 893 and above)
2. Check Oil level (893 and above) top up if necessary
3. Ensure all safety devices are in place (i.e. guards fitted)
4. Remove any safety devices fitted to prevent machine rotation

Starting up should be performed or supervised by suitably qualified personnel.

MOUNTING POSITIONS

† Gear units for use in mounting positions B6 and B7 should only be selected with overall ratios greater than or equal to those shown in the table below.

* Mounting positions B6 are not recommended for geared motors. Please consult your local authorised distributor.

Unit Size	Input Speed (rpm)			
	1000	1500	1800	>1800
890-895	All	All	All	Consult your local distributor
896	All	11:1	14:1	
897	11:1	20:1	25:1	
898	16:1	32:1	36:1	

Plug positions apply for sizes 893 and larger. ○ Ventilator/Filling Position ● Level Position ● Drain Position

TABLE 1 LUBRICATION QUANTITY (LITRES) TRIPLE REDUCTION

890, 891 & 892 if supplied without lubricant, fill with the correct amount as indicated in the table below. 893 - 898 - fill gearbox until oil escapes from level plug.

Unit Size	Mounting Position					
	B3	V6/V3	V5/V1	B8	B7	B6
890	0.5	0.8	0.7	1.0	1.2	0.9

All Fenner Series K geared motors are identified by a product code number; this can consist of an eight or nine digit number depending on the type of motor fitted or the style of unit.

The basic 8 digit code giving the unit type, size, ratio and motor power should be taken from the selection tables. A break down of the coding system for the basic unit and the other options is given below. If a special motor is required a ninth digit is usually added to the end of the normal 8 digit code, see the table below.

These codes should be included on all enquiries, correspondence and orders.

FIRST TWO DIGITS:

Product prefix—constant for Series K = **89**

THIRD DIGIT: unit size **0–8**

FOURTH DIGIT:

MOUNTING TYPE

- A:** Motorised with Standard Hollow Bore
- D:** Input Reducer Assembly with Standard Hollow Bore
- G:** Standard Hollow Bore unmotorised (ready to fit motor)
- X:** Shrink Disc RH side - motorised
- Y:** Reducer - Shrink disc RH side
- Z:** Reducer - Shrink disc RH side

FIFTH AND SIXTH DIGIT: Gear Ratio Code. (for exact ratio see page 296)

SEVENTH/EIGHTH DIGITS:

Type of drive code

1. Motorised units - use complete code from selection tables with if applicable, additional ninth digit for motor type.
2. Input Reducer assembly - use **00**.
3. Unmotorised units ready for a motor fitting by a third party - use the three digit code as shown in the table below

Code	Frame	Flange
63C	63	B14
63D	63	B5
71C	71	B14
71D	71	B5
80C	80	B14
80D	80	B5
90C	90	B14
90D	90	B5
10C	100/112	B14
10D	100/112	B5
13D	132	B5
16D	160	B5
18D	180	B5
20D	200	B5
22D	225	B5
25D	250	B5

NINTH DIGIT:

Type of motor variant

Use eight digit code obtained from selection tables for required motor power and speed and then add the relevant letter code from table below of the motor variant required.

Code	Motor Type
A	Anti-condensation heaters fitted
B	Backstop Fitted
E	Fitted with Encoder
L	Clutch/brake fitted
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer to Original Quote - Special
S	Single Phase motor
T	Fitted with Thermistors
X	Fitted with Variator
Z	Fitted with Force Vent unit

GEARED MOTOR ACCESSORIES

To compliment the Fenner Series, M, C, F & K range of gearboxes a range of backstops suitable for all sizes and types.

MOTORISED BACKSTOP MODULE

Motorised backstop modules can be fitted between the gear unit and motor of all the gearbox types shown in this catalogue. The backstop device incorporates high quality centrifugal lift off sprags which are wear free above the lift off speed (n min).

To ensure correct operation motor speed must exceed lift off speed. Suitable for ambient temperature - 40°C + 50°C

When a backstop module is fitted dimension K1 should be added to the overall length of the geared motor assembly.

Rotation of outputshaft must be specified when ordering as viewed from the output shaft end (as shown in the diagram below).

Motor Frame Size	Lift off speed (n min) (rev/min)	Rated Locking torque (T max) at motor (Nm)	og6	K1
100	670	170	250	70
112	670	170	250	70
132	620	940	300	95
160	620	940	350	130
180	620	940	350	130
200	550	1260	400	130

WARNING: Removal of motor or backstop will release the drive. Ensure all driven machinery is secure prior to any maintenance work.

REDUCER BACKSTOP MODULE

The reducer units listed below can be fitted with an internal backstop, this has no effect on the external unit size. The backstop device incorporates high quality centrifugal lift off sprags which are wear free above the lift off speed (n min). To ensure correct operation input speed must exceed lift off speed.

Suitable for ambient temperature -40°C to + 50°C

Rotation of outputshaft must be specified when ordering as viewed from the outputshaft end (as shown in the diagram below)

Standard Motor Specification

Conforming in performance to BS5000 and IEC34-1 in dimensions to BS4999 and IEC72-1 and 2.

Range mounting, squirrel cage, totally enclosed fan cooled design (TEFC).

Protection

IP55, dust and hose proof.

Insulation

Class F.

ELECTRIC MOTORS (BS AND IEC SPECIFICATION)

ELECTRIC MOTOR VARIANTS

All variants of standard IEC frame motors can be fitted to the Fenner gearmotor range. They are also capable of accepting NEMA motor variants as well. Examples of some of the variants and their ninth digit code letter are:-

Code	Motor Type
A	Anti-condensation heaters fitted
B	Backstop Fitted
C	Cast Iron motor
D	Brook Motor Fitted
E	Fitted with Encoder
F	Flameproof motor
G	Fitted with Oil seal
H	Class H Insulation
I	IP65 enclosure
J	Inverter-motor
K	Fitted with Tacho-generator
L	Clutch/Brake unit Fitted
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer To Original Quote - Special
R	Fitted with Brook ARGUS Cast Iron motor
S	Single Phase motor
T	Fitted with Thermistors
V	Special Voltage
W	WIMES Spec motor (Water Industry)
X	Fitted with Variator
Z	Fitted with Force Vent unit
5	ExN Non-Sparking motor
8	Two-speed motor
9	Special Feature

Standard clutch brake modules with IEC flanges can be fitted between motor and gearhead. Variable speed packages are available, either belt variators or mechanical disc variators. For any of these combinations please contact your local Authorised Distributor.

Dimensions A, B and C are based on the standard motor normally supplied, for details when another type of motor is required consult your local Authorised Distributor.

Starting torque, starting current and current at various voltages vary depending on the type of unit. Consult your local Authorised Distributor.

* Last two digits of the complete eight digit ordering code from the selection tables.

Fenner®

SERIES W

WORM REDUCTION

A modular designed aluminium worm box available in a vast range of sizes and ratios for cost effective solutions.

- 11 Sizes with ratings from 0.06 to 15kW
- Ratios from 5:1 to 5000:1 with helical or double worm combinations
- Interchangeable dimensionally with other makes
- Hollow bore or solid shaft versions
- Accepts standard IEC motors

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?** electrical supply available
- **If motorised:** any special motor features required (brake, clutch, flameproof etc.)
- **If non-motorised:** type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Shaft mounting or foot mounted?**
if shaft mounted, machine shaft diameter/length
if foot mounted, is an output shaft coupling required?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

Electric Motors	334

SELECTION PROCEDURE

(a) Service Factor

From Table 1 select the Mechanical Service Factor (Fm) applicable to the drive.

If the unit is to be subjected to frequent stop/starts then multiply factor **Fm** by Factor **Fs** from table 2.

(b) Motor Power

Refer to the selection tables on pages 312 to 317 and choose a motor power equal to or in excess of that required, if the motor power is not known then from the formula below determine the power requirements of the driven machine and select a motor power in excess of the calculated machine absorbed power.

$$P_A = \frac{T \times n_2}{9550}$$

- PA = Machine absorbed power (kW)
- T = Machine absorbed torque (Nm)
- n₂ = Machine speed (Rev/Min)

(c) Unit Selection

Refer to the selection tables on page 312 to 317 and choose a motor power equal to or closest above that calculated in step (b). Then read down the column headed "Nominal Output Speed" until a speed equal to or near to the required speed is found. On this line read across to the service factor column and check that the service factor exceeds the value from step (a). If the service factor is either lower or much higher than that required check the speeds at each side of the required speed to see if a more suitable unit and factor can be found.

(d) Overhung Loads

If the unit is to be fitted with an output shaft and an indirect drive attached to the shaft, calculate the overhung load value using the formula on page 332 and compare this value with the maximum allowable value given in column 5 of the selection tables. If the value exceeds the maximum allowed, then either re-design the indirect drive or select a larger unit capable of supporting the overhung load.

(e) Shaft mounted

If the unit is to be shaft mounted determine the relevant machine shaft size from the dimension tables on page 318. Torque arm dimensions can be found on page 321.

SELECTION EXAMPLE

A series W shaft mounted gearbox is required to drive a variable density mixer, which absorbs 450 Nm at 36 rev/min and operates for up to 8 hours per day. The mixer stops and starts on average 4 times a day. Specify the shaft diameter required to fit the unit selected, a torque arm bracket is also required please specify the relevant product code.

(a) Service Factor

From table 1, a variable density mixer is classed as a moderately loaded machine and when running for 8 hours per day has a service factor of 1.2.

The machine stops and starts only 4 times a day therefore an additional stop/start factor is not required.

(b) Motor Power

To determine the required motor power use the absorbed torque and the machine shaft speed in the formula given. Then use the next largest standard motor power above this.

Therefore the absorbed Power PA =

$$\frac{450 \times 36}{9550} = 1.7 \text{ kW}$$

(c) Unit Selection

The nearest standard motor power above 1.7 kW is 2.2 kW therefore we go to the 2.2kW geared motor selections on page 316.

Reading down the column headed nominal output speed it is found that there are 2 units listed at 36 rev/min, at the first one of these read across to maximum service factor column, it can be seen that the unit size 747A0645 has a service factor of 1.4.

This exceeds the 1.2 Service factor required and therefore is suitable for the application.

(d) Overhung Loads

The gearbox is to be shaft mounted therefore there are no overhung loads present.

(e) Shaft Mounted

The unit is to be shaft mounted, referring to page 318 we see that the hub bore size is 42 mm.

From page 321 the torque arm bracket to suit the size 747 unit selected has a product code of 748A9600.

TABLE 1 - MECHANICAL SERVICE FACTOR Fm

Types of Driven Machine	Operational hours per day			
	under 2	2 to 8	over 8 to 16	Over 16
Uniform Loads Agitators and Mixers – liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	0.80	1.00	1.20	1.50
Moderate Shock Loads Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes, travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Pumps – reciprocating with 3 or more cylinders Pulp and Paper Making Machinery Rubber Mixers and Calenders Screens – rotary Textile Machinery	1.00	1.20	1.40	1.70
Heavy Shock Loads Brick Presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Pumps – reciprocating, 1 or 2 cylinders Rubber Masticators Screens – vibrating	1.20	1.40	1.60	2.0

For High Inertia Applications, consult your authorised distributor for verification of selection

*** See page 398 for notes on reducing service factors**

TABLE 2 - STARTING SERVICE FACTOR Fs

	Start/stops per hour					
	Up to 5	6 - 20	21 - 30	31 - 50	51 - 80	81 - 100
Uniform Load	1.00	1.05	1.10	1.15	1.20	1.25
Moderate Shock Load	1.05	1.10	1.20	1.25	1.35	1.40
Heavy Shock Load	1.20	1.25	1.30	1.40	1.45	1.50

All Dimensions in mm. For alternative hollow bore options see page 319 and the relevant motorised worm unit size.

The frame size of the electric motor fitted to a worm unit determines the helical gear part of the assembly, the relevant dimensions are given in the above table

Eg: Dimension G (the overall length) for a size 743 Helical Worm gearbox fitted with an IEC 71 Frame motor is 193mm.

** Number in brackets are the number of tapped holes.

~kg Refers to the approximate weight without motor.

ORDERING INSTRUCTIONS

FIRST THREE DIGITS: Gearmotor size.

Select from the tables on pages 312 to 317 for motorised units and pages 324 to 327 for non-motorised units.

FOURTH DIGIT: Mounting Type.

- A:** Standard Bore - Motorised worm gear unit
- B:** Standard Bore - Motorised worm/worm combination gear unit
- D:** Standard Bore - Motor ready worm gear unit
- E:** Standard Bore - Motor ready worm/worm combination unit
- G:** Standard Bore - Speed reducer worm gear unit
- H:** Standard Bore - Speed reducer worm/worm combination unit
- Z:** Alternative Bore - Motorised worm gear unit
- Y:** Alternative Bore - Motorised worm/worm combination unit
- W:** Alternative Bore - Motor ready worm gear unit
- V:** Alternative Bore - Motor ready worm/ worm combination unit
- T:** Alternative Bore - Speed reducer worm gear unit
- S:** Alternative Bore - Speed Reducer worm/worm combination unit

FIFTH AND SIXTH DIGIT: Gear Ratio Code.

1. Assemblies A and B use complete eight digit code obtained directly from selection tables. Exact gear ratios can be found on page 327.
2. For selection and specification for D, E, G and H assemblies then consult your local Authorised Distributor.

SEVENTH/EIGHTH DIGITS: Type of drive

1. Motorised units - use complete code from selection tables with if applicable, additional ninth digit for motor type.
2. Input reducer assembly - use **00**
3. Motor ready - units ready to accept a standard IEC frame motor, use code from table below.

Code	Frame	Flange
56C	56	B14
56D	56	B5
63C	63	B14
63D	63	B5
71C	71	B14
71D	71	B5
80C	80	B14
80D	80	B5
90C	90	B14
90D	90	B5
10C	100/112	B14
10D	100/112	B5
13C	132	B14
13D	132	B5
16D	160	B5

NINTH DIGIT:

Additional feature.

Code	Additional Feature
A	Anti-condensation heaters fitted
B	Backstop Fitted
E	Fitted with Encoder
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer To Original Quote - Special
S	Single Phase motor
T	Fitted with Thermistors
X	Fitted with Variator
Z	Fitted with Force Vent unit

EFFICIENCY - STATIC AND DYNAMIC IRREVERSIBILITY

EFFICIENCY

Efficiency is a parameter which has a major influence on the sizing of certain applications, and basically depends on gear pair design elements.

The mesh data table on page 329 shows dynamic efficiency ($n_1=1400$) and static efficiency values. Remember that these values are only achieved after the unit has been run in.

DYNAMIC IRREVERSIBILITY

Dynamic irreversibility is achieved when the output shaft stops instantly when drive is no longer transmitted through the worm shaft. This condition requires a dynamic efficiency of $\eta_d < 0.5$ (see table on page 329).

STATIC IRREVERSIBILITY

Static irreversibility is achieved when, with the gear reducer at a standstill, the application of a load to the output shaft does not set in motion the worm shaft. This condition requires a static efficiency of $\eta_s < 0.5$ (see table on page 329).

The tables below shows approximate irreversibility classes.

Vibrations and shocks can affect a gear reducer's irreversibility.

For the irreversibility conditions of a combined geared unit one must consider that the efficiency of the group is given by the product of the efficiencies of each single reducer, i.e.

$$\eta_{tot} = \eta_1 \times \eta_2$$

DYNAMIC IRREVERSIBILITY

η_d	Dynamic Irreversibility
>0.6	dynamic reversibility
0.5 ÷ 0.6	low dynamic reversibility
0.4 ÷ 0.5	good dynamic irreversibility
< 0.4	dynamic irreversibility

STATIC IRREVERSIBILITY

η_s	Static Irreversibility
> 0.55	static reversibility
0.5 ÷ 0.55	low static reversibility
< 0.5	static irreversibility

ALLOWABLE OVERHUNG LOADS

Units are fitted with input and output bearings of ample proportions to cater for the radial and thrust loads imposed by the gearing, leaving sufficient capacity for taking typical overhung loads.

The calculated overhung load should be compared with the value in the selection tables.

These values may be exceeded at lower input speeds or if limited bearing lives are acceptable. In cases where higher overhung load capacities are necessary consult your distributor, quoting details of power, speed, direction of gearbox rotation, angle of application of load, distance of load application from gearbox and acceptable bearing life.

Permissible overhung loads vary according to the direction of rotation. The values tabulated are for the most unfavourable direction with the unit transmitting full rated power and the load applied midway along the shaft extension. Hence they can sometimes be increased for a more favourable direction of rotation, or if the power transmitted is less than the rated capacity of the gear unit, or if the load is applied nearer to the gear unit case. Refer to your Distributor for further details. In any event, the sprocket, gear etc. should be positioned as close as possible to the gear unit case in order to reduce bearing loads and shaft stresses, and to prolong life.

All units will accept 100% momentary overload on stated capacities.

To determine the overhung load when a sprocket, gear or 'V' pulley is fitted to the output shaft, one of the following formulae may be used in the absence of accurate information.

(1) Calculation on a basis of Torque

$$\text{Overhung load (N)} = \frac{T \times 1000 \times K}{r}$$

(2) Calculation on a basis of Power

$$\text{Overhung load (N)} = \frac{kW \times 9550 \times 1000 \times K}{n \times r}$$

Where:

T = Absorbed torque at worm gear output shaft in Nm.

kW = Absorbed torque at worm gear output shaft in (kW).

r = Pitch radius of sprocket, gear or 'V' pulley in mm.

n = Rev/min of worm gear output shaft.

K = Application factor -

1.00 for a sprocket

1.25 for a gear or timing pulley

1.50 for a 'V' pulley

The same formulae can be used to calculate the overhung load on the input shaft, substituting the input torque or kW for the output values.

Overhung loads may be reduced by one of the following methods:

- (1) Increase the diameter of the sprocket, gear or pulley within reasonable limits.
- (2) Mount the sprocket, gear or pulley on a separate shaft, supported on its own bearings and couple to the worm gear output shaft by means of a Fenner shaft coupling.
- (3) Use a special extended output shaft and support the free end with an outrigger bearing.

DISTANCE MIDWAY ALONG SHAFT EXTENSION

* For Output Shaft Overhung Load Capacities (Fra) see the relevant selection tables

Output shaft dimensions refer to both motorised and non motorised units.

Satisfactory performance depends on proper installation, lubrication and maintenance. All instructions given in the installation leaflet must be followed carefully.

Shaft Mounting

Ensure that the shaft on to which the gear unit is to be mounted and the gear unit bore are clean and free from burrs. Liberally smear the shaft and bore with lubricants to aid assembly and prevent fretting corrosion. Slide the unit on to the driven shaft fit side fitting key. **DO NOT USE TAPER OR TOP FITTING KEY.**

Foot Mounting

Mount the unit securely to a rigid structure. Fit the output extension shaft as required use flexible couplings such as Fenaflex for shaft to shaft connections and ensure that shaft misalignment is within the couplings capacity. When a pulley or sprocket is fitted to either shaft, mount it as close as possible to the gearcase.

When fitting or removing drive components do not hammer on shaft as this will damage the bearings, Fenner Taper Lock bushes permit easy fixing and dismantling without undue force.

LUBRICATION CAPACITY

Unit size	All Positions	Mounting Position	Unit Size		
			748	749	750
740	0.02	B3	3.0	4.5	7.0

745	0.55				
746	1.00				
747	1.60				

MOUNTING POSITIONS

○ Ventilator/Filling Position ● Level Position ● Drain Position

LUBRICATION

Sizes 740 to 747 are pre-filled with IP TELIUM VSF 320 a synthetic gear oil suitable for permanent lubrication. They can be mounted in any position. Sizes 745, 746 & 747 should not be installed in the V5 or V6 position without prior consultation.

The synthetic oil used is suitable for ambient temperatures between -25°C and +50°C

Sizes 748, 749 and 750 are pre-filled for mounting position B3 with IP MELLANA OIL 220, a mineral based gear oil. Other mounting positions must be specified on order.

The Mineral oil used is suitable to operate in ambient temperatures between -15°C and +25°C

Helical-worm Gear Unit

The helical modules are supplied as a sealed for life unit complete with a long-life synthetic oil, AGIP TELIUM VSF320 and can be mounted in all positions.

The lubrication is separate from that of the worm gear unit.

Worm/worm Combination Units

When using a worm/worm combination unit both gearboxes are lubricated separately.

Both units are supplied lubricated up to size 747, on sizes above 747 the small unit will be supplied lubricated, the large one not.

Use the mounting position detail below and fill to the required level.

BREATHERS/MOUNTING POSITIONS

Sizes 740 to 747 are supplied for operation without breathers, level & drain plugs.

Sizes 748 to 750 are supplied for operation with a breather but are dispatched with a closed transport plug. When the unit is in its operating position it is essential to replace the transport plug with the breather plug (supplied) in the position indicated on the installation leaflet prior to operating the unit.

MAINTENANCE

The high quality of Series W ensures that the unit will operate correctly with only the minimum amount of maintenance. Periodically check that the exterior of the assembly is clean, especially the cooling areas; periodically check for any oil leaks especially around the oil seals.

Sizes 740 to 747 are lubricated for life and do not require any special maintenance other than stated above.

Sizes 748 to 750 will require an oil change between 8/10000 hours of use depending on the type of environment and use. Make sure the breather hole in the plug is clean and using the oil window, check for sufficient lubricant. Should it be necessary to top up the lubricant use the same type that is already in the unit or one that is compatible with it. If in doubt we recommend you empty the oil from the gearbox completely and before refilling with new oil, wash out the unit to remove any residue.

Standard Motor Specification

Conforming in performance to BS5000 and IEC34-1 in dimensions to BS4999 and IEC72-1 and 2.

Flange mounted, squirrel cage, totally enclosed fan cooled design (TEFC).

Protection

IP55, dust and hose proof.

Insulation

Class F.

**ELECTRIC MOTORS
(BS AND IEC SPECIFICATION)****ELECTRIC MOTOR VARIANTS**

All variants of standard IEC frame motors can be fitted to the Fenner gearmotor range. Examples of some of the variants and their ninth digit code letter are:-

Code	Additional Feature
A	Anti-condensation heaters fitted
B	Backstop Fitted
E	Fitted with Encoder
M	Brake motor
N	Brake motor with Hand Release
P	Premium Efficiency Motor Fitted (EFF1)
Q	Refer To Original Quote - Special
S	Single Phase motor
T	Fitted with Thermistors
X	Fitted with Variator
Z	Fitted with Force Vent unit

Modular fit clutches, brakes and backstops are also available along with a range of variable speed units, please refer to page xxx or contact your local authorised distributor for further details.

Dimensions A, B and C are based on the standard motor normally supplied, for details when another type of motor is required consult your local Authorised Distributor.

Starting torque, starting current and current at various voltages vary depending on the type of unit. Consult your local Authorised Distributor.

* Last two digits of the complete eight digit ordering code from the selection tables.

Fenner®

CYCLO

EPICYCLIC GEARBOX

A whole new concept in gear design using a patented epicyclic gear profile to offer trouble free, high ratio solutions to a wide range of industries.

- 21 sizes with ratings from 0.12 to 55kW
- Ratios from 6:1 to 658,503:1
- 500% shock overload capacity
- 2 year warranty
- Dry-fit gearhead
- Standard IEC or integrated motor options
- Compact, silent & low maintenance

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?**
- **If motorised:** electrical supply available
any special motor features required (brake, clutch, flameproof etc.)
- **If non-motorised:** type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Flange mounted or foot mounted?**
if foot mounted, is an output shaft coupling required?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

Fenner® Cyclo

REVOLUTIONARY DESIGN OFFERS SMOOTH, SILENT, EFFICIENT OPERATION

The revolutionary design of the Cyclo discs offers smooth and silent operation and excellent resistance to overloads. Extremely high ratios can be achieved within a very small envelope offering high efficiency in a very small package.

- High overload capacity up to 500%
- Offering high efficiency, especially at high reduction ratios
- Compact size and low noise level
- High reliability with 2 years warranty
- Exceptional life compared to other types of gearing

www.fptgroup.com

OPERATING PRINCIPLE

The unique concept of the Cyclo unit provides exceptional performance, reliability and long life in the most severe applications.

Unlike Helical gears, the Cyclo has thirty percent of its reduction components in contact at all times offering an extremely high overload capacity.

As the Eccentric bearing rotates, it rolls the Cyclo Disc around the internal circumference of the stationary Ring Gear Housing (an action similar to that of a wheel rolling around the inside of a ring).

As the Cyclo Disc travels in a clockwise path around the Ring Gear Housing, the Cyclo Disc itself rotates slowly on its own axis in the opposite direction. For each complete revolution of the INPUT shaft, the Cyclo Disc turns one cycloidal tooth pitch in the opposite direction.

The ratio of the Cyclo drive is numerically equal to the number of cycloidal teeth on the Cyclo Disc.

The reduced speed is transmitted to the OUTPUT shaft by means of the Slow speed shaft pins and rollers which engage with the holes located around the middle of each disc. Typically a Two-Disc system is used allowing a smoother and vibration-free drive with a higher torque capacity.

SELECTION PROCEDURE

(a) Service Factor

From table 1 select the Mechanical Service Factor (Fm) applicable to the drive.

If the unit is to be subjected to frequent stop/starts then multiply factor **Fm** by Factor **Fs** from table 2.

(b) Motor Power

Refer to the selection tables on pages 338 to 341 and choose a motor power equal or in excess of that required.

If the power is not known, use the formula below to establish a minimum input power and select from the nearest available selection table.

$$P_A = \frac{M \times n_2}{9550}$$

P_A = Absorbed power (kW)

T = Output torque (Nm)

n_2 = Output speed (rpm)

(c) Unit Selection

Refer to the selection tables for the required motor selected in step (b) on pages 338 to 341.

Read down the column to find the closest speed to meet your requirements. Trace along the line to the service factor from step (a).

If the service factor is either lower or significantly higher than that required, scan up and down to establish if a better selection is available.

(d) Overhung Loads

If an indirect drive is to be fitted to the output shaft, calculate the overhung load value using the formula below and ensure that the maximum allowable overhung load is not exceeded. If the calculated overhung load is greater than the allowable overhung load, either re-design the indirect drive or select a unit with a greater overhung load capacity.

$$F_{Rq} = \frac{2000 \times M_{ef} \times F_{B1} \times L_f \times C_f}{PCD \text{ of drive element (mm)}}$$

F_{Rq} = Equivalent radial load used for selection (N)

M_{ef} = Required output torque (Nm)

F_{B1} = Service factor from section (a)

L_f = Correction factor for load position

C_f = Correction factor for type of drive

C_f value for different drive types

- Chain = 1.00**
- Pinion = 1.25**
- V-Belt = 1.50**

SELECTION EXAMPLE

A Fenner Cyclo geared motor unit is required to operate a stone crusher that will start 35 times a day and operate for a total of 9 hours per day.

The absorbed torque is 700Nm and the speed required is 50rpm. There will be a flexible coupling on the output shaft so the Overhung Load will not be an issue.

(a) Service Factor

From table 1 a stone crusher has been classified as a Heavy Shock Load. The service factor for such a unit operating at up to 10 hours per day is shown as 1.35.

The unit is going to experience frequent stop/starts so the Fm factor needs to be multiplied by the Fs factor from table 2. For Heavy Shock Loads <200 stop/starts per day, the Fs factor is 1.25.

(b) Motor Power

As we do not know the motor power required, we need to calculate it based on our torque requirement.

Therefore the absorbed Power P_A =

$$\frac{700Nm \times 50 \text{ rpm}}{9550} = 3.66 \text{ kW}$$

(c) Unit Selection

Refer to the selection table relevant to the closest motor size of 4.0kW on page 340. Look down the Output speed column for the nearest speed to 50rpm and for a unit with a service factor equal to or greater than 1.69.

The closest selection is a 614X1146.

TECHNICAL NOTES

Tolerances according to DIN ISO 286 part 2.
Keys and keyways according to DIN 6885

MOUNTING POSTIONS

Foot mounted and Flange mounted units from size 606 - 612 are grease lubricated for life and suitable for any mounting position.

Units from size 613 - 616 are oil lubricated for Horizontal and vertical mounting.

Size 616 requires an additional oil pump and circulating pipe when used in the vertical position - please consult your local Authorised Distributor.

Size 613-616 Flange mounted units use special Ring Gear Housings.

TECHNICAL NOTES

Tolerances according to DIN ISO 286 part 2.
Key and keyways according to DIN 6885.

MOUNTING POSTIONS

Foot mounted units from size 606DA - 612DB are grease lubricated for life and suitable for any mounting position.

Other sizes are either grease or oil lubricated based upon mounting position - typically, Horizontally mounted units up to 616DB are grease lubricated and larger units are oil lubricated.

Vertical mounted units are grease lubricated with the exclusion of 616DC - 619DB that use special oil lubrication systems.

Tolerances according to DIN ISO 286 part 2.
Key and keyways according to DIN 6885.

MOUNTING POSITIONS

All Three-stage CYCLO units are grease lubricated.

Size 606TA - 612TB are suitable for all mounting positions and are maintenance free.

Sizes 613TA and above are also grease lubricated for all mounting positions but on units mounted vertically, the gearheads have double sealing on the output and shielded bearings.

TECHNICAL NOTES

Tolerances according to DIN ISO 286 part 2.
Key and keyways according to DIN 6885.

MOUNTING POSTIONS

Foot mounted units from size 606 - 612 are grease lubricated for life and suitable for any mounting position.

Units from size 613 - 616 are oil lubricated for Horizontal and vertical mounting.

Size 616 requires an additional oil pump and circulating pipe when used in the vertical position - please consult your local authorised distributor.

Size 613-616 Flange mounted units use special Ring Gear Housings.

FOOT MOUNTED

Reducer Selection

SPEED REDUCER SELECTION TABLES - 580rpm Input

These rating tables are based on a service factor of 1.0 - suitable for 10hrs/day at Uniform Load.

- M_2 = Allowable output torque (Nm)
- F_{R2} = Allowable Radial load applied to middle of shaft (N)
- P_1 = Allowable Input Power (kW)
- n_2 = Output Speed (rpm)

SPEED REDUCER SELECTION TABLES - 720rpm Input

These rating tables are based on a service factor of 1.0 - suitable for 10hrs/day at Uniform Load.

- M_2 = Allowable output torque (Nm)
- F_{R2} = Allowable Radial load applied to middle of shaft (N)
- P_1 = Allowable Input Power (kW)
- n_2 = Output Speed (rpm)

SPEED REDUCER SELECTION TABLES - 1450rpm Input

These rating tables are based on a service factor of 1.0 - suitable for 10hrs/day at Uniform Load.

- M_2 = Allowable output torque (Nm)
- F_{R2} = Allowable Radial load applied to middle of shaft (N)
- P_1 = Allowable Input Power (kW)
- n_2 = Output Speed (rpm)

TWO STAGE REDUCER SELECTION - 980rpm Input

These rating tables are based on a service factor of 1.0 - suitable for 10hrs/day at Uniform Load.

- M_2 = Allowable output torque (Nm)
- F_{R2} = Allowable Radial load applied to middle of shaft (N)
- P_1 = Allowable Input Power (kW)
- n_2 = Output Speed (rpm)

Reducer Selection

TWO STAGE REDUCER SELECTION - 2900rpm Input

These rating tables are based on a service factor of 1.0 - suitable for 10hrs/day at Uniform Load.

- M_2 = Allowable output torque (Nm)
- F_{R2} = Allowable Radial load applied to middle of shaft (N)
- P_1 = Allowable Input Power (kW)
- n_2 = Output Speed (rpm)

Reducer Selection

TWO STAGE REDUCER SELECTION - 1450rpm Input

These rating tables are based on a service factor of 1.0 - suitable for 10hrs/day at Uniform Load.

- M₂ = Allowable output torque (Nm)
- F_{R2} = Allowable Radial load applied to middle of shaft (N)
- P₁ = Allowable Input Power (kW)
- n₂ = Output Speed (rpm)

All dimensions are in mm

TECHNICAL NOTES

Keys and keyways acc. to DIN 6885-1

Tolerances according to DIN ISO 286-2

Output Shaft Tolerances are k6 up to and including Ø35mm and h6 from Ø50mm and above. Input shafts of Ø22mm and below have a k6 tolerance and from Ø30mm and above have a h6 tolerance.

MOUNTING POSITIONS

Foot mounted and Flange mounted units from size 606 - 612 are grease lubricated for life and suitable for any mounting position.

Units from size 613 - 625 are oil lubricated for Horizontal and vertical mounting.

For unit sizes 616 and above there is an additional oil circulating pump system required for vertical mounting positions - please consult your local Authorised Distributor.

All speed reducers are also available as flange mounted or face mounted, for additional dimensions please see page 345.

LUBRICANT QUANTITIES

Size	Oil Qty*
613	0.7
614	0.7
616	1.4
617	1.9
618	2.5
619	4.0
620	5.5
621	8.5
622	10.0
623	15.0
624	16.0
625	21.0
626	29.0
627	56.0

* For foot mounted horizontal units this quantity is an approximate figure only - the actual fill quantity should be determined by means of the oil level gauge.

TECHNICAL NOTES

Keys and keyways acc. to DIN 6885-1
 Tolerances according to DIN ISO 286-2
 Output Shaft Tolerances are k6 up to and including Ø35mm and h6 from Ø50mm and above. Input shafts of Ø22mm and below have a k6 tolerance and from Ø30mm and above have a h6 tolerance.

MOUNTING POSITIONS

Size 606DA - 616DB are Grease lubricated for all mounting positions.
 Size 616DC - 627DA are oil lubricated for Horizontal mounting and grease lubricated for vertical mounting positions.
 All speed reducers are also available as flange mounted or face mounted, for additional dimensions see page 345.

LUBRICANT QUANTITIES

Size	Oil Qty*
616DC	1.5
617DC	2.4
618DB	3.5
619DA	5.8
619DB	6.0
620DB	6.0

*The kg shown is an additional weight of couplings and adaptor to be added to the speed reducer weight on page 366

Larger frames are available on request - please contact your local authorised distributor

~ For k dimensions refer to page 366.

MINIMUM MOTOR POWER REQUIREMENTS

Two stage units require a minimum input power in order to provide a safe start under difficult conditions.
The gearheads are limited by their rated output torque.

Note: Operation with full motor power is not possible and we advise some method of torque limiting be installed.

Minimum Input Power & Breakaway Torque

MINIMUM INPUT POWER REQUIREMENTS

A minimum input power is necessary to accelerate the reducer to its rated input speed under its worst operating conditions within the thermal available time. The values shown give the necessary power per 100rpm at the input shaft. The output torque during operation may not exceed the maximum allowable torque.

Size	Combination	Input Power (kW/100rpm)
606DA	606+606	0.0067

BREAKAWAY TORQUE

The Breakaway Torques shown below are obtained with standard lubrication and do not include any dynamic torques or external loads. The ambient temperature is taken as 20°C. These values are average values and a deviation of ±50% has to be considered.

The **BOLD** figure is for speed increasers (driving the output shaft) and the other figure is for standard speed reducers (driving the input shaft).

To determine breakaway torque (T_B) for units with more than one stage, use the following formulae:

Slow speed $T_B = T_{B1} + T_{B2} / i_1$

High speed $T_B = T_{B1} + T_{B2} \times i_2$

T_{B1} = 1st stage T_B T_{B2} = 2nd stage T_B i_1 = Ratio 1st stage i_2 = Ratio 2nd stage

SIZE	Breakaway Torque Required at Ratio (Nm)

Ordering Instructions

These codes should be included on all enquiries, correspondences and orders.

FIRST THREE DIGITS:

Unit Size

Select from the tables on pages 338-341 for motorised units.

Single stage units use just the size code e.g. **606**

Multistage units use the size with letters e.g. **606DA/606TA**

FOURTH DIGIT:

Mounting Type

- X:** Foot Mounted - standard IEC motor
- Y:** Flange Mounted - standard IEC motor
- Z:** Face Mounted - standard IEC motor
- A:** Foot Mounted - alternative integrated motor
- B:** Flange Mounted - alternative integrated motor
- C:** Face Mounted - alternative integrated motor
- D:** Foot Mounted Motor ready to suit IEC motor
- E:** Flange Mounted Motor ready to suit IEC motor
- F:** Face Mounted Motor ready to suit IEC motor
- G:** Foot Mounted - Speed Reducer
- H:** Flange Mounted - Speed Reducer
- J:** Face Mounted - Speed Reducer

FIFTH AND SIXTH DIGIT:

Ratio Code.

The two digit code can be obtained from the Ratio Codes table opposite.

SEVENTH AND EIGHTH DIGITS:

Input Code

Motorised units use a unique motor code obtained from the selection tables.

Speed reducers are given a code of **00**

Motor ready units use the frame size code of the motor input required taken from the table below.

Code	Frame	Flange	ØShaft	Flange
63C	63	B14	11	90
63D	63	B5	11	140
71C	71	B14	14	105
71D	71	B5	14	160
80C	80	B14	19	120
80D	80	B5	19	200
90C	90	B14	24	140
90D	90	B5	24	200
10C	100/112	B14	28	160
10D	100/112	B5	28	250
13D	132	B5	38	300
16D	160	B5	42	350

NINTH DIGIT:

Type of motor variant

Additional motor features as below:

Code	Motor Type
A	Fitted with A/C heaters (specify voltage 110/230v)
B	Fitted with motorised backstop module (specify rotation)
N	Fitted with brake & Hand Release (specify voltage)
P	Fitted with premium efficiency EFF1 motor
S	Fitted with Single Phase motor
T	Fitted with Thermistors
Q	Special - refer to serial number records
Z	Fitted with Force Vent Unit

Fenner®

SMSR

The Fenner® SMSR PowerPLUS offers a rugged design and a 50% increase in the power to weight ratio over older versions. The powerPLUS range is more compact for easier handling and features an increased range of bore sizes.

- 13 sizes in the range
- Three standard bore options
- Bore sizes range from 20mm to 190mm
- Torque capacity up to 45,000Nm
- Taper-Grip bush for easy removal and fitting
- Ratios up to 200:1 with a simple belt drive

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?** electrical supply available
- **If motorised:** any special motor features required (brake, clutch, flameproof etc.)
- **If non-motorised:** type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Shaft mounting or foot mounted?**
if shaft mounted, machine shaft diameter/length
if foot mounted, is an output shaft coupling required?
- **Orientation of input/output**
parallel or right angle?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

GEARBOX SELECTION PROCEDURE

(a) Service Factor

From Table 1 select the service factor applicable to the drive.

(b) Design Power

Multiply the absorbed power (or motor power if absorbed power not known) by the service factor chosen in step (a).

NOTE:

Gear units are momentarily capable of transmitting twice (2x) the rated capacity on start or during operation.

(c) Unit Selection

Using the value from step (b) refer to the power rating tables on page 276 and select the correct size of unit.

The choice of single or double reduction gearbox will be determined by the output speed required. The normal operating speeds for each of the gearboxes may be observed in the power rating and belt drive tables.

For other speeds consult your local Authorised Distributor.

BELT DRIVE SELECTION

Selection of associated belt drive for 1440 rev/min. electric motors

(d1) Output Speed

Refer to the Drive Selection Tables (pages 283 to 286 and under the appropriate gearbox size and ratio read down the column headed 'Output Speed' until an Output Speed equal or

near to that required is found.

The suggested ratio is given in the first column.

(e1) Pulley Diameters

Read across from the chosen output speed to obtain both driving and driven pulley pitch diameters, groove section and the appropriate number of belts.

NOTE:

In many instances one belt is recommended, being adequate for power transmission purposes; where customer preference is for multi-belt drives consult your local Authorised Distributor.

(f1) Centre Distance

Belt length and centre distance can be found by referring to pages 40-51.

(g1) Hub Bore Size

Refer to the output hub dimensions table on page 277 for the range of bore sizes available.

Selection of associated belt drive for driving speeds other than 1440 rev/min.

(d2) Gearbox Input Shaft Speed

Multiply the gearbox output speed by the exact gear ratio (found in the table on page 279) to obtain the gearbox input shaft speed.

(e2) Selection of 'V'-Drive

The correct belt drive can now be selected by referring to page 38.

NOTE:

Wedge belt drives shown on pages 283 to 286 have been selected to give the most economical total drive package for the

speed required. If it is necessary to design a special drive it is advisable to consult your local Authorised Distributor.

Torque arm should preferably be in tension when unit is in operation. See page 287.

If in any doubt consult your local Authorised Distributor.

EXAMPLE

A Shaft Mounted Speed Reducer is required for a uniformly loaded elevator which absorbs 3.6 kW at 50 rev/min. The prime mover is a 4 kW 1440 rev/min. direct on line start electric motor. A belt drive is required between the motor and gearbox at approximately 700 mm centres running for up to 24 hours/day.

SOLUTION

Selection Procedure

(a) Service factor

From Table 1 the service factor is 1.25.

(b) Design Power

Using the elevator absorbed power of 3.6 kW.

Design Power = 1.25 x 3.6 = 4.5 kW.

(c) Unit Selection

Using 4.5 kW as the basis for selection reference to the power rating tables (page 276) indicates that an E13 or E20 gear unit will transmit 6.48 kW at 50 rev/min.

Selection of associated belt drive

(d) Output Speed

A more economic belt drive will be obtained if the 20:1 ratio gearbox is selected, and by reference to page 284 in the gearbox drive tables 50 rev/min. is obtainable.

(e) Pulley Diameters

On the line giving the output speed of 50 rev/min read across and note the driving and driven pulley pitch diameters together with the numbers of belts required, which for this case is 106 mm and 150 mm, using 2 XPA Wedge Belts.

(f) Belt Selection

By reference to page 44 it can be seen that XPA 1800 belts give 699 mm centres.

(e) Available Bores

By referring to the output hub bore dimensions table on page 277, it can be seen that the size E is available with a range of bore sizes in both parallel bore and Taper Grip bush.

Parallel bore sizes are 55, 50 and 65mm whilst Taper Grip is available in 42mm and 55mm.

TABLE 1—SERVICE FACTORS

Types of Driven Machine	Operational Hours Per Day		
	Under 10	10 to 16	Over 16
Uniform Agitators and Mixers - liquid or semi-liquid Blowers – centrifugal Bottling Machines Conveyors and Elevators – uniformly loaded Cookers Laundry Washing Machines – non-reversing Line Shafts Pumps – centrifugal and gear Wire Drawing Machines	1.00	1.12	1.25
Moderate Shock Agitators and Mixers – variable density Conveyors – not uniformly loaded Cranes, travel motion and hoisting Drawbench Feeders – pulsating load Hoists Kilns Laundry Tumblers Lifts Piston Pumps – with 3 or more cylinders Pulp and Paper making machines Rubber Mixers and Calenders Rotary Screens Textile Machinery	1.25	1.40	1.60
Heavy Shock Brick presses Briquetting Machines Conveyors – reciprocating and shaker Crushers Feeders – reciprocating Hammer Mills Piston Pumps – 1 or 2 cylinders Rubber Masticators Vibrating Machines	1.60	1.80	2.00

M	190*		-		190	130

All dimensions in millimetres unless otherwise stated.

(1) STANDARD HUB BORES

Metric hubs are bored to F7 limits, Inch hubs are bored to H7 limits.

A shaft tolerance grade h7 is recommended.

Shaft keyways must be appropriate standard dimensions, i.e. to BS 4235 for "metric" shafts and BS 46 for "inch" shafts.

* Max Hub bore size M reducer is 190mm, smaller bores are available to customer requirements — consult your local Authorised Distributor

† The alternative hub bore is the maximum bore available in each unit size.

(2) TAPER-GRIP™ HUB BORES

Shaft with tolerances up to h11 can be accommodated.

AGMA output hubs conforming to North American standards are available. Consult your local Authorised Distributor.

STANDARD HUB KEYWAYS

Keyways for the standard Output Hubs and Bushes are machined in accordance with BS 4235 for metric shafts and BS 46 for "inch" shafts.

Keys are supplied with reduction bushes, but not where the output hub directly fits the shaft.

Reduction bushes may be supplied with two separate keys for hub and shaft or a single stepped key, depending on the bush wall thickness.

The shaft keyway should be machined to suit the standard key size shown below, regardless of the hub bore diameter.

Shaft Diameter (mm)	Key size
20	6 x 6
25	8 x 7
30	8 x 7
32	10 x 8
35	10 x 8
38	10 x 8

	double	11	15	21	31	45	69	92	133	197	268	385	545

All dimensions are in millimetres. Keyways are British Standard metric.

* Measured in the direction of DD.

† Permits 150mm adjustment to tighten V-Belts. By cutting off threaded end of rods dimension 'S' may be reduced by up to 300mm sizes B & C, 350mm on sizes D & E, 395mm on sizes F, G, H, J & S, 300mm on size K, 330mm on size L, 335mm on size M.

NEW UP-RATED TAPER-GRIP™ LOCKING SYSTEM

Fenner Shaft Mounted Speed Reducers can be secured to the driven shaft by a unique bush locking system which overcomes the difficulties experienced with other methods of mounting, particularly in corrosive environments.

The new design includes cap head screws for higher tightening torques and a hardened steel thrust plate. These two new features are responsible for part of the significant torque increase.

UP-RATED TAPER-GRIP

- Transmits 300% more torque
- Accommodates shaft tolerances to h11
- Standard bores require no key
- Accessible locking arrangement
- Reversible bush assembly
- Resistant to fretting corrosion
- Even easier removal of gear unit

Assembly

After the bush is screwed into the hub the reducer can be conveniently positioned on the driven shaft. Locking is effected by sequential tightening of the screws which draw the bush axially against the opposing tapers in the hub thus generating the clamping force along the whole length of the bush in contact with the shaft.

Removal

The Taper-Grip system offers significant advantages when removing the reducer from the shaft.

There is a tendency for Shaft Mounted Reducers, subject to atmospheric or fretting corrosion, to seize solidly onto the shaft, making removal difficult and time-consuming.

The Taper-Grip system eliminates this problem, the bush is manufactured from spheroidal graphite iron which not only has similar mechanical properties to steel but has a natural resistance to corrosion and a degree of self-lubricity.

This combination of dissimilar materials in contact alleviates fretting corrosion and when the bush screws are loosened and the tapers released there is sufficient clearance within the assembly to permit easy removal.

Because the bush is screwed into the hub it is inherently safe. Even if the locking screws are completely removed it cannot inadvertently fall out during reducer handling.

Use of smaller than standard bores on Taper-Grip bushes

For applications where it is desirable to fit Taper-Grip bushes with bores smaller than the standard catalogue sizes, depending on the size, the torque capacity of the bush may be below the quoted catalogue ratings. In these situations it is preferable to fit a key to the bush/shaft interface. In these cases please consult your local Authorised Distributor.

TRANSMITS 300% MORE TORQUE

Taper Lock®

Taper Grip™

Ordering Instructions

GEARBOX CODING

The required unit is identified by an eight digit code as under:

First Three Digits:	Product Prefix	Constant 116
Fourth Digit:	Unit Size	B C D E F G H J S T K L M
Fifth and Sixth Digits:	Ratio Code	05. 13. 20 & 25
Seventh Digit:	Indicates Assembly	0 Shaft Mounted Speed Reducer
Eighth Digit:	Indicates Output Hub bore required	1 Standard Metric bore † 2 Upper Alternative Metric bore † 5 Taper-Grip Hub

† The hub bushes in the table opposite can be used in all three parallel hub bore options.

Example

Size G Unit 20:1 nominal Gear Ratio. shaft mounted with standard Metric Hub Bore (75mm) 116G2001.
If Backstop or Output Bushes are required, these should be ordered separately.
e.g. 116G2001 complete with Backstop and 60 mm Output Hub Bushes.

TAPER-GRIP CODING

Taper-Grip units are supplied without the Taper-Grip Bush. These should be ordered separately, see table below.

First Three Digits:	Product Prefix	012 Metric bores	013 Inch bores
Fourth Digit:	Unit Size	B C D E F G H J S T K L M	
Fifth Digits:	Constant	1	
Sixth, Seventh and Eighth Digit:	Indicates Taper-Grip bore size in millimetres or inches	Metric Bore	Bore Code
		Inch Bore	Bore Code
		25	025
		30	030
		35	035
		40	040
		45	045
		50	050
		55	055
		60	060
		65	065
		75	075
		85	085
		90	090
		100	100
		120	120
		125	125
		130	130
		150	150
		190	190
		1/4	104
		1/2	108
		2	200
		2 1/2	208
		3	300

Example

Size G Unit 20:1 nominal Gear Ratio. shaft mounted with Metric Taper-Grip Bore (75 mm). SMSR code is 116G2005.
Taper-Grip bush code is 012G1075.

BACKSTOP CODING

The required backstop size is identified by an eight digit code:

First Three Digits:	Product Prefix	044
Fourth Digit:	Unit Size	B, C, D, E, F, G, H, J, S, T, K, L, M
Fifth, Sixth, Seventh & Eight Digit:	Product Suffix	0003

Example: 044G0003 - Size G PowerPlus backstop

OPTIONAL EXTRAS

Backstops

Incorporated to prevent reversal of rotation. Quickly installed within the reducer, by simply removing a cover plate.

Flange Mounting

All gear cases now have drilled and tapped holes in the input drive face for bolting direct to a supporting framework. This flange mounting use of the reducer eliminates a bearing or pillow block. However the belt adjustment feature of shaft mounting is also lost, see page 287.

Reversing Duty

Shaft Mounted Speed Reducers suitable for reversing duty can be supplied to order.

Vertical Shafts

Units suitable for mounting on vertical shafts can be supplied at extra charge. When ordering, please specify whether input shaft is above or below.

AGMA Output Hubs

Bores conforming to North American standards are available.

Screw Conveyors

Screw conveyor adaptors conforming to CEMA mounting specifications are available.

FOR INSTALLATION AND OPERATION OF BELT DRIVES SEE PAGE 74 OF THIS CATALOGUE

GEARBOX INSTALLATION

Satisfactory performance depends on proper installation, lubrication and maintenance. Therefore it is important that the instructions in the Installation and Maintenance leaflet, supplied with each gearbox, are followed carefully. Some of the important aspects of belt and torque-arm installation are listed below.

1. Install pulley on gearbox input shaft as close to the reducer as possible. See fig. 1. Failure to do this will cause excess loads in the input shaft bearings and could cause their premature failure.
2. Install motor and wedge belt drive with the belt pull at approximately 90° to the centre line between driven and input shafts. See fig. 2. This will permit tensioning of the wedge belt drive with the torque-arm which should preferably be in tension. If output hub runs anti-clockwise the torque arm should be positioned to the right. See fig. 3.
3. Install torque-arm fulcrum on a rigid support so that the torque-arm will be at approximately right angles to the centre line through the driven shaft and the torque arm case bolt. See fig. 4. Make sure there is sufficient take up in the turn-buckle for belt tension adjustment.

FOR INSTALLATION AND OPERATION OF BELT DRIVES SEE PAGE 74 OF THIS CATALOGUE

When ordering parts for reducer, please specify

- Reducer Size
- Reducer Serial No.
- Part Name
- Code number
- Quantity required

LUBRICATION – QUANTITIES & RECOMMENDED GRADES

Fenner Power Plus Shaft Mounted Speed Reducers are dispatched without oil. Before running they should be filled with an appropriate amount of lubricant as shown in the tables, dependent on the mounting position. Fill to level plug when reducer is not running. Drain, flush and refill as directed in the installation leaflet supplied with every gearbox, check oil level regularly.

Positions of filler, breather and drain plug for different mounting positions are shown in fig. 1. **CAUTION.** Too much oil will cause over-heating. Too little oil will cause gear and bearing failure.

Normal operating positions are shown in fig 1. Note that the reducer is supplied with four plugs. After the reducer has been mounted in its running position the plugs must be located as shown in fig 1 for the appropriate mounting position.

If the reducer is not within 20 degrees of one of the positions shown, the oil level plug cannot be safely used to check the oil level. This can be overcome by disconnecting the torque-arm and swinging the reducer around to one of the positions shown. Because of the many positions of fitting the reducer it may be necessary or desirable to make special adaptations using the plug holes in the reducer with standard pipe fittings standpipes or oil level gauges, consult your local Authorised Distributor.

MANUFACTURERS AND TYPES

B.P ENERGOL GR-XP	CASTROL ALPHA ZN OR SP	MOBIL MOBILGEAR & SHC	SHELL OMALA	TEXACO MEROPA
-------------------------	------------------------------	-----------------------------	----------------	------------------

NOTE: Do not use E.P. mineral oils other than those recommended when using a backstop.

These compact right angle gearboxes excel because of their high efficiency and universal mounting facilities.

By the utilisation of spiral bevel gears within the lightweight alloy casing, low noise emission is assured throughout the speed band.

All units are factory filled with longlife synthetic lubricant, thus eliminating regular maintenance requirements. The two smaller sizes in the range are lubricated for life.

All shafts are manufactured from high quality steel and ground to B.S. 4500:1969, j6 limits.

Keyways are in accordance with B.S. 4235 Part 1: 1972

SELECTION PROCEDURE

(a) Service Factor

From Table 1 select the service factor applicable to the drive.

(b) Design Power

Multiply the power or output torque by the service factor to obtain the Design Power or Design Torque.

(c) Gear Ratio

Determine the Gear Ratio and whether it is speed reducing or increasing.

(d) Unit Selection

Refer to the power ratings (Table 2 overleaf) and from the required ratio, trace to the right along the input speed line until a power or torque in excess of the figure determined in step (b) is found. At the head of the column, note the size of unit required.

N.B. For input speeds between those listed, it is sufficiently accurate to interpolate. For speeds below 100 rev/min, assume a constant torque output capacity.

(e) Rotation

Note the required rotation shown opposite.

Overloads

Bevel geared units are designed to withstand momentary overloads of 100%.

Overhung loads

For permissible overhung loads for each application consult FPT.

Recommended Lubricants

BP	Energrease FG00-EP
DARMEX	Darmex 00
MOBIL	Mobilplex 45
SHELL	Simnia 0
TEXACO	Marfak 0

Quantities

Size	A	B	C	D
Kg	-	-	0.11	0.18

TABLE 1 – SERVICE FACTORS

Driven machines characteristics	Hours per day duty		
	under 3	3 to 12	over 12
Uniform Loads	0.8	1.0	1.25
Moderate Shock Loads	1.0	1.25	1.5
Heavy Shock Loads	1.5	1.75	2.0

ORDERING INSTRUCTIONS

Unit code number derived as follows:

<u>920</u>	<u>A</u>	<u>2</u>	<u>100</u>
1	2	3	4

1. Product prefix is constant at 920
2. Unit size – see selection procedure
3. Rotation – see opposite
4. Gear Ratio – see Table 2

The above code would designate an A size unit rotation 2 with 1 : 1 gear ratio.

RATIOS AND ROTATIONS

Input Shaft	Available ratios	
	S	1 : 1
T	1 : 1	2 : 1

Speed Increasing Duty

When used for speed increase SHAFT 'S' must be the input or drive shaft.

Speed Reducing Duty

When used for speed reducing SHAFT 'T' must be the input or drive shaft.

Fenner® GT

The Fenner® GT is a simple, cost effective integrated motor fitted to any one of a wide range of gearheads. Operation is simple; the large calibrated control knob provides precise speed control.

- 15 power outputs between 0.25 to 11 kW
- IP 65 protection
- 200% starting torque capability
- Rapid screwless fixing
- Universal mounting positions

Geared Drives Design Data Required

- **Motorised (integral motor) or non-motorised?**
- **If motorised:** electrical supply available
any special motor features required (brake, clutch, flameproof etc.)
- **If non-motorised:** type of prime mover
rotational speed of prime mover
power rating of prime mover
is an input shaft coupling required?
if so, prime mover shaft dia.
- **Shaft mounting or foot mounted?**
if shaft mounted, machine shaft diameter/length
if foot mounted, is an output shaft coupling required?
- **Orientation of input/output**
parallel or right angle?
- **Type of driven machine**
- **Rotational speed of driven machine**
constant or variable over what range?
- **Power absorbed by driven machine**
(or required output torque)
- **Hours/day duty & start/stop frequency**

FENNER GT

Page

Introduction	395
Dimensions	396
Installation	397
Environmental Characteristics	397

The Fenner® GT is a simple, cost effective integrated motor fitted to any one of a wide range of gearheads. Operation is simple; the large calibrated control knob provides precise speed control.

Start, stop and reverse button options are available. The electronics are moulded in resin to eliminate vibration and humidity damage.

Other options including remote control, parameter setting console, brake resistors, brakes and various field bus protocols can be supplied, please ask your local Authorised Distributor.

- The NEW addition to the range of Fenner® Motorised Gear units is the Fenner® GT, an ideal solution for the replacement of those troublesome mechanical variators which are becoming harder to maintain and repair.
- Available with the full range of Fenner® gearheads and covering the input power range of 0.25kW through to 11kW.
- This variable speed integrated motor provides an easy to install replacement drive with the minimum of disruption to the existing layout.
- Enclosed to IP65 and delivered ready to run.

SERIES M	MAXTORQUE	4,500 Nm	SPEED RANGE 3 TO 786 REV/MIN
SERIES C	MAXTORQUE	4,000 Nm	SPEED RANGE 3 TO 360 REV/MIN
SERIES F	MAXTORQUE	6,400 Nm	SPEED RANGE 2 TO 448 REV/MIN
SERIES K	MAXTORQUE	5,000 Nm	SPEED RANGE 1 TO 285 REV/MIN
SERIES W	MAXTORQUE	1,400 Nm	SPEED RANGE 5 TO 400 REV/MIN

INSTALLATION

The following notes are an indication of the Installation procedures, see full instruction manual when carrying out any installations.

The Fenner GT is fitted to any machine like a standard motor or gear motor with either foot or flange mounting.

The positions of the potentiometer/cable gland supports are specified at time of ordering. However they may be reversed.

TERMINAL BLOCK

Standard configuration

Marking	Functions - Characteristics
L1, L2 L1, L2, L3 PE	Connection of protected mains supply phases
R1, R2	Connection of the braking resistor Min. resistance value = 180 Ohms

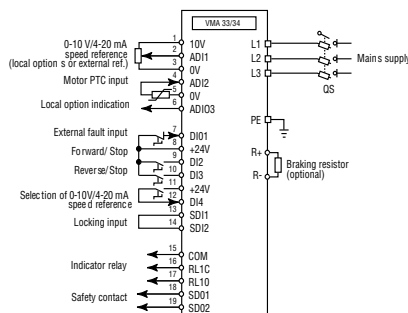

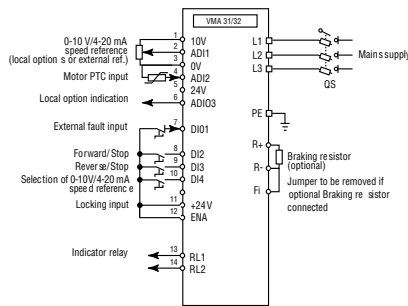

P2 Connector

This is used to connect the Fenner GT operating options

P3 Connector RS232 serial link

This is used to connect the Parameter setting and PC programming software options.

Fenner GT Standard Connection Diagrams

Note: For single-phase versions, the power supply is connected to terminals L and N.

ENVIRONMENTAL CHARACTERISTICS

Protection Index	IP65
Storage temperature	-40 to + 70°C (IEC 68.2.3)
Transport temperature	-40 to + 70°
Operating temperature	-20 to +40°C (+50°C with derating)
Altitude	= 1000 m without derating
Ambient humidity	95% non condensing
Vibration	IEC 68-2-34 (acceleration 0.01 g2/Hz)
Shocks	IEC 68-2-29 (peak acceleration 15g)
Immunity	Conforming to EN 61000-6-2
Radiated conducted emissions	Conforming to EN 50081-2 with internal filter
UL standard	Conforming to FILE E211799

FENNER GT30 OPERATING OPTIONS

- VMA-B-4429850 Fenner GT31/32 Speed Control Knob With run and trip LED's
- VMA-BMA-4429849 Fenner GT31/32 Speed Control Knob with Integral Run/Stop option and LED's
- VMA-BMAVAR-4429851 Fenner GT31/32 Speed Control Knob with Integral For/Rev/Stop option and LED's
- VMA-Plate-4073165 Fenner GT30 Series Blanking Plate
- VMA-CVIVMA31-32-4429852 Fenner GT31/32 Internal Set Speed Control option Giving Max/Min and Set speed setting by potentiometer with run and trip LED's
- VMA-CDCVMA30-4438305 Fenner GT30 Series Parameter Setting Console c/w interconnecting cable (L=3m)
- VMA-B30-44277672 Fenner GT33/34 Speed Control Knob With run and trip LED's
- VMA-BMA30-4277673 Fenner GT33/34 Speed Control Knob with Integral Run/Stop option and LED's
- VMA-BMAVAR30-4277674 Fenner GT33/34 Speed Control Knob with Integral For/Rev/Stop option and LED's
- VMA-CVIVMA30-4277671 Fenner GT33/34 Internal Set Speed Control option Giving Max/Min and Set speed setting by potentiometer with run and trip LED's

Save up to 20% On Energy Consumption

Selecting the correct product for the application will help ensure you maximise the potential for energy savings at your site, a few important considerations are highlighted below.

The selection of drive systems and their associated motors are most commonly made on the basis that the motor will be Direct on Line Started for the lower power ranges and Star/Delta started for the remainder.

The DOL and Star/Delta start both produce a shock load, irrespective of the driven machine and therefore cause stress within the overall drive train as well as the machine being driven which adversely affects the service factor.

Additionally, where the frequency of start/stop is high, there is a further requirement to increase in the overall size of the gear unit and associated transmission equipment being selected adding significantly to the overall cost of the drive.

SERVICE FACTOR IMPROVEMENT

With the ever decreasing cost of electronic control systems, their selection for use in conjunction with electro-mechanical drive systems has many advantages.

Soft starters provide a low cost solution to reducing the stresses of starting and most types of unit can also provide a soft stop function, ideal for use in pumping applications.

The reduction in starting/stopping shock loads enables a lower service factor to be applied in the selection calculations, which in some cases will result in a much lower cost selection, without prejudice to the overall expected life of the transmission train.

ENERGY SAVING

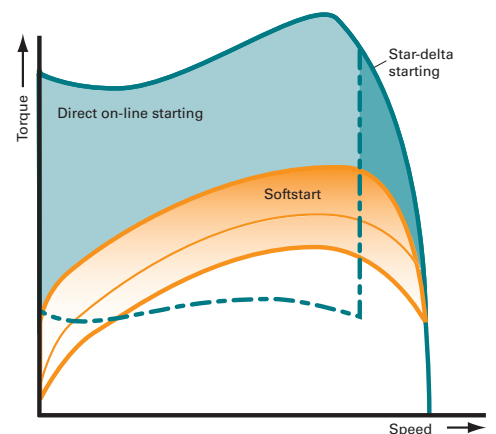

The selection and use can be further enhanced by providing the control via an inverter, which in addition to the controlled start and stop of a machine, can provide the added advantage of speed variation to provide optimum performance and ensure the maximum amount of energy saving.

The use of inverters and softstarts may require an initial increase in the installation and commissioning cost but the reduction in overall lifetime costs and in the case of the inverter, the savings in energy consumption deliver a quick payback period and then continue to offer savings throughout the life of the installation.

This enables Fenner® Authorised Distributors to offer extended warranty periods in many instances where a softstart/inverter and geared drive solution is purchased.
