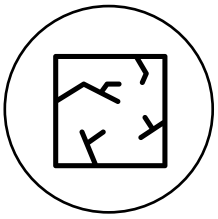
OSCILLATING MOUNTINGS

Elastic suspensions for all types of screening machines, shaker conveyors and gyratory sifters

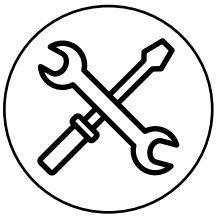
– Components for all types of vibrating machines and conveyors
– Vibration-damping mountings for circular and linear vibrating screens
– Double rocker arms for high-speed vibrating conveyor troughs
– Spring accumulators for machines in near-resonant operation
– Rocker arms and push rod heads for sliding-crank gutters
– Universal joint bearings for gyratory sifter screening machines
– Spring accumulator for resonance-based operation

Product advantages:

long service life



shatterproof



maintenance-free

Selection tables Oscillating Mountings

			 **One mass system** circular motion screen	 **One mass system** linear motion screen	 **Two mass system** with counterframe	 **One mass system** linear motion screen hanging	
	Illustration	**Type**	Description				Page
Elements for free oscillating systems (with unbalanced excitation)		**AB** **ABI**	Oscillating Mounting – universal mounting. High vibration isolation and low residual force transmission. Natural frequencies approx. 2 – 3 Hz. 9 element sizes from 50 N to 20 000 N.				3.4 – 3.5
		**AB-HD** **ABI-HD**	Oscillating Mounting for impact loading and high production peaks (Heavy Duty). Natural frequencies approx. 2 – 4 Hz. 11 element sizes from 150 N to 60 000 N.				3.6 – 3.7
		**HS** **HSI**				Oscillating Mounting for hanging systems. Natural frequencies approx. 3 – 5 Hz. 7 element sizes from 150 N to 14 000 N.	3.8
		**AB-D**		Oscillating Mounting in compact design. Optimal in two mass systems as counter-frame mounting. Natural frequencies approx. 3 – 4.5 Hz. 7 element sizes from 500 N to 16 000 N.			3.9

			 **Gyratory sifter upright staying**	 **Gyratory sifter hanging**	
	Illustration	**Type**	Description		Page
Elements for gyratory sifters		**AK**	Universal joint for the support or suspension of positive drive or freely oscillating gyratory sifting machines. 10 element sizes up to 40 000 N per AK.		3.19
		**AV**	Single joint specially designed with a large rubber volume for the suspended gyratory sifters. Models with right-hand and left-hand threads. 5 element sizes up to 16 000 N per AV.		3.20

					
			One mass system «brute-force» system	**One mass system** «natural frequency» system	**Two mass system** «fast-runner» system with reaction force compensation
	Illustration	**Type**	Description		Page
Elements for guided systems (crank driven)		**AU** **AUI**	Single Rocker for a variable arm length. Models with right-hand and left-hand threads. 7 element sizes up to 5 000 N.		3.10
		**AS-P** **AS-C**	Single rocker with standardized center distance. 6 sizes up to 2 500 N for flange fixation. 6 element sizes up to 2 500 N for central fixation.		3.11 – 3.12
		**AD-P** **AD-C**		Double rocker with standardized center distance. 5 element sizes up to 2 500 N for flange fixation. 4 element sizes up to 1 600 N for central fixation.	3.13 – 3.14
		**AR**	Single rocker and double rocker with adjustable length, connection of the AR elements using round pipe. Two mass shakers with bi-direction flow are simply to realize. 3 element sizes up to 1 600 N.		3.15
		**ST** **STI**	Drive Head for crank drive transmission. Models with right-hand and left-hand threads. 9 element sizes up to 27 000 N.		3.16 – 3.17
		**DO-A**		Spring accumulator with high dynamic spring value for feeder systems running close to resonance frequency. A spring accumulator consists of 2 DO-A elements. 5 element sizes up to dynamic spring value of 320 N/mm.	3.18

* compression load $G_{max.}$ and cold flow compensation (after approx. 1 year).

If no other units are specified, the numbers given are in mm.
Customized Oscillating Mountings Type AB-HD with low natural frequency and high load capacity.
The sizes 100-2.5 to AB-HD 100-4 can be combined with one another (identical heights and operation behaviour).
Dynamic spring value: Values in nominal load range at 960 min^{-1} and 8 mm of oscillating stroke sw
Operating parameters by rpm: Acceleration > 9.3 g is not recommended

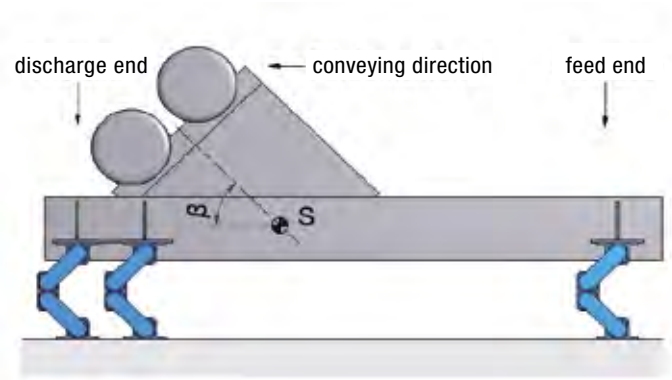
The threaded connection rod has to be provided by the customer.

OSCILLATING MOUNTINGS

Oscillating mountings – free oscillating systems

Calculation bases



Subject	Symbol	Unit
Mass of the empty channel and drive *	m_0	kg
Products on the channel *	m_m	kg
Total vibrating mass	$m = m_0 + m_m$	kg
Mass distribution: feed end	% feed end	%
discharge end	% discharge end	%
Acceleration due to gravity	g	9.81 m/s²
Load per corner feed end	F feed end	N
Load per corner discharge end	F discharge end	N
Working torque of both drives	AM	kgcm
Oscillating stroke empty channel	sw_0	mm
Oscillating stroke in operation	sw	mm
Motor revolutions	n_s	min^{-1}
Centrifugal force of both drives	Fz	N
Oscillating machine factor	K	
Machine acceleration	$a = K \cdot g$	g

Calculation formulas

Loading per corner

$$F_{feed\ end} = \frac{m \cdot g \cdot \%\ feed\ end}{2 \cdot 100} \qquad F_{discharge\ end} = \frac{m \cdot g \cdot \%\ discharge\ end}{2 \cdot 100} \quad [N]$$

Oscillating stroke

$$sw_0 = \frac{AM}{m_0} \cdot 10 \qquad sw = \frac{AM}{m} \cdot 10 \quad [mm]$$

Centrifugal force

$$F_z = \frac{\left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot AM \cdot 10}{2 \cdot 1000} = \frac{n_s^2 \cdot AM}{18'240} \quad [N]$$

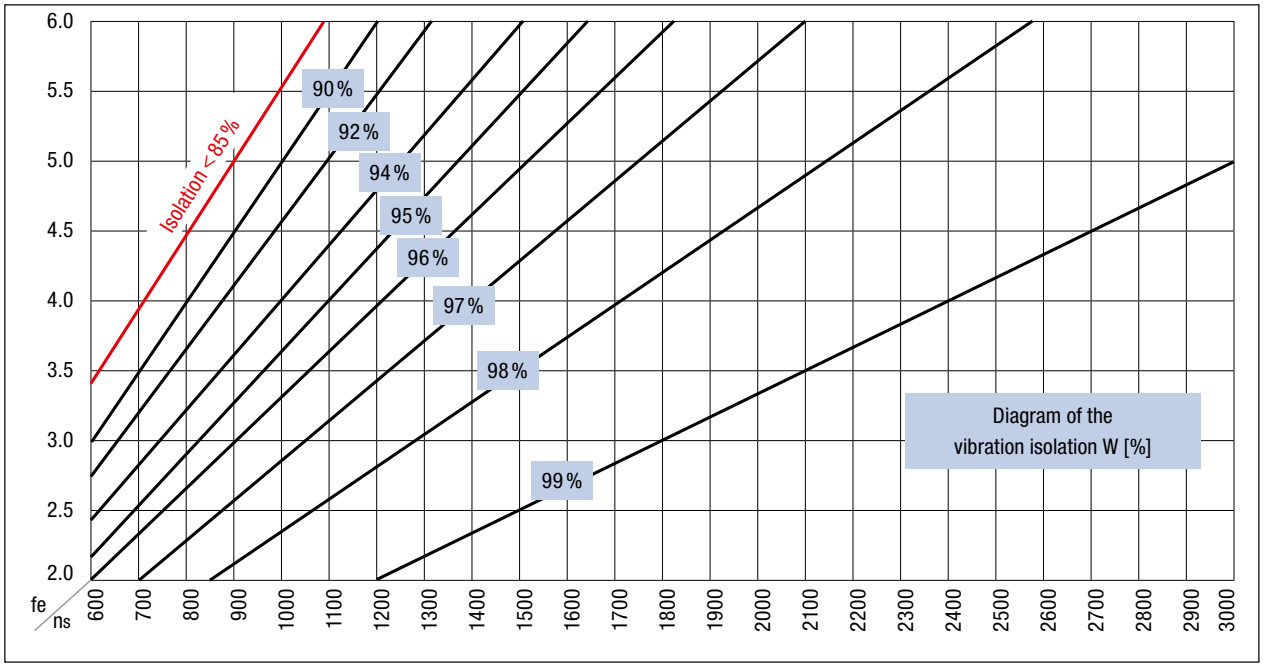
Oscillating machine factor

$$K = \frac{\left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot sw}{2 \cdot g \cdot 1000} = \frac{n_s^2 \cdot sw}{1'789'000} \quad [-]$$

* When determining the weight, take into account:
- High coupling or sticking of humid bulk material
- Channel running full
- Fully stacked screen deck with humid material
- Weight distribution with and without conveyed material
- Centrifugal force does not run through the center of gravity (channel full or empty)
- Sudden impact loading occurs
- Subsequent additions to the screen structure (e. g. additional screening deck)

Oscillating mountings – free oscillating systems

Vibration isolation

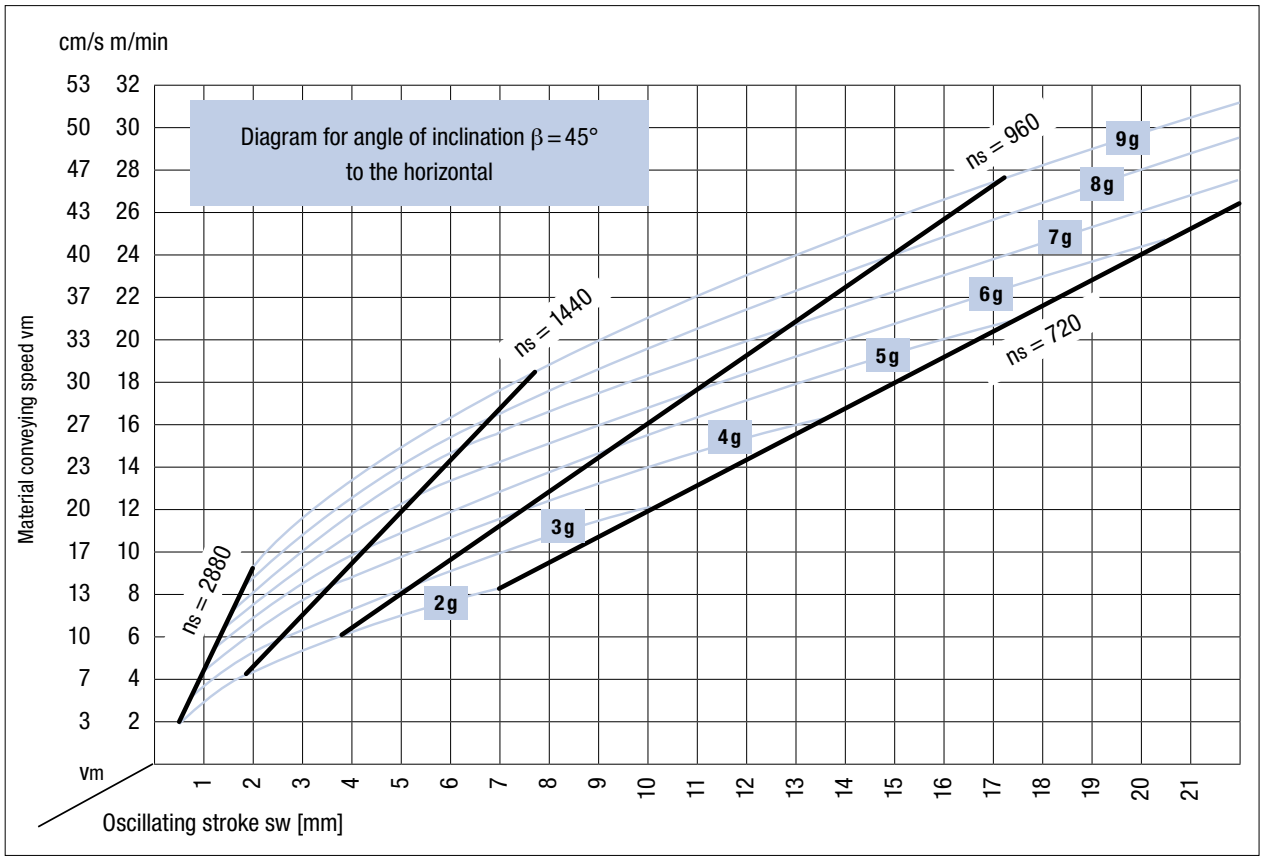


Calculation formula

$$W = 100 - \frac{100}{\left(\frac{n_s}{60 \cdot fe}\right)^2 - 1} \quad [\,\%\,]$$

Oscillating mountings – free oscillating systems

Average material conveying speed v_m

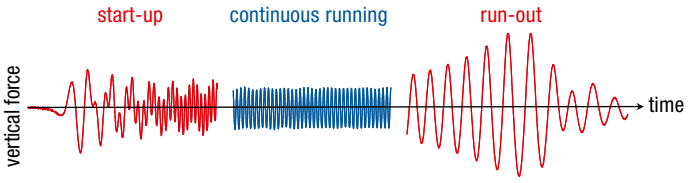


Main influencing factors
– Conveying ability of the material
– Height of the bulk goods
– Inclination of screen base
– Drive angle of the exciters in linear oscillators
– Position of the centre of gravity

The material speed on circular motion screens varies and depends largely on the tilt of the screen box.

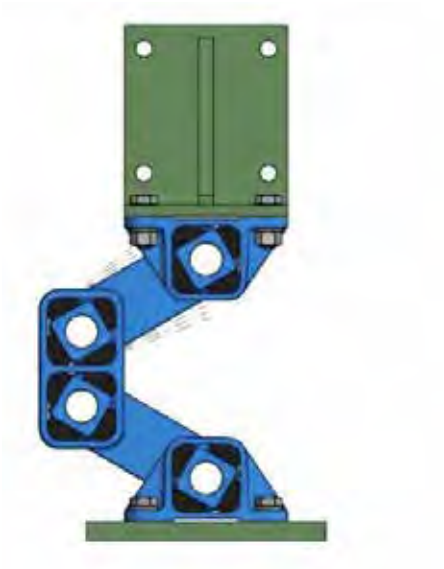
Oscillating mountings – free oscillating systems

Operating and resonance behaviour



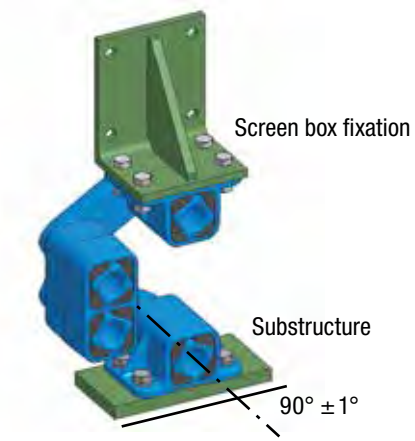
Laboratory measurements of a typical development of the residual forces on a ROSTA screen suspension.

At the screen start-up and run-out, the element's natural frequency is passed through. During the resulting amplitude superelevation, the four rubber suspension elements generate a high level of damping, which greatly reduces the vibration amplitudes. The screen box therefore stops fully after only a few strokes.



The rocker arm fixed to the screen carries out the greater part of the oscillations. The rocker arm fixed to the substructure remains virtually stationary, provides a strong cushion and ensures a low natural frequency and therefore a good insulation on the base frame.

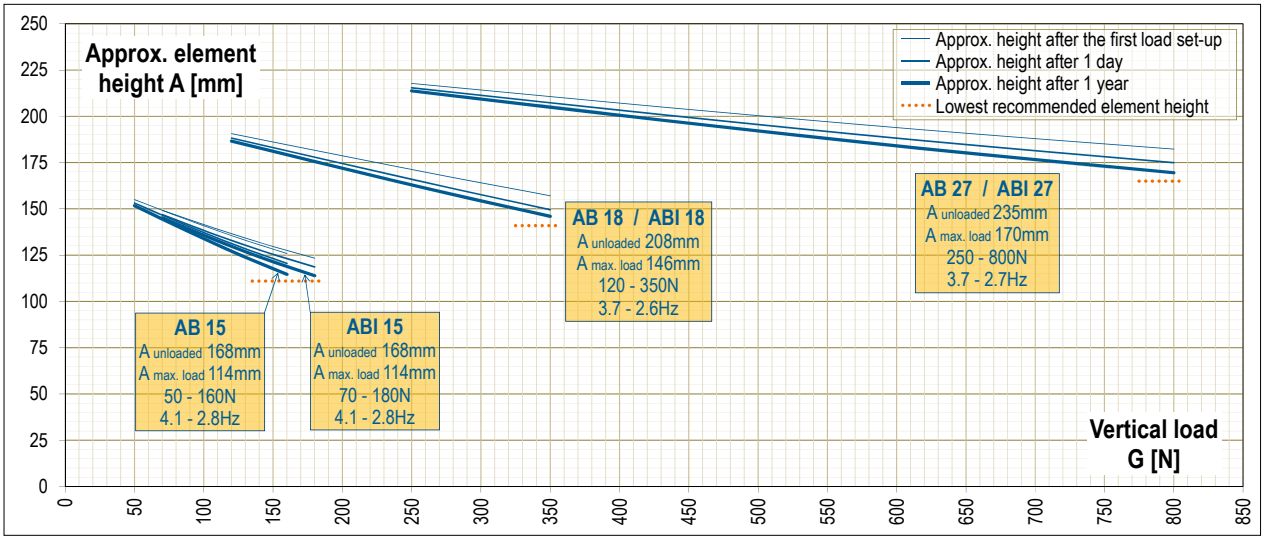
Alignment of the elements

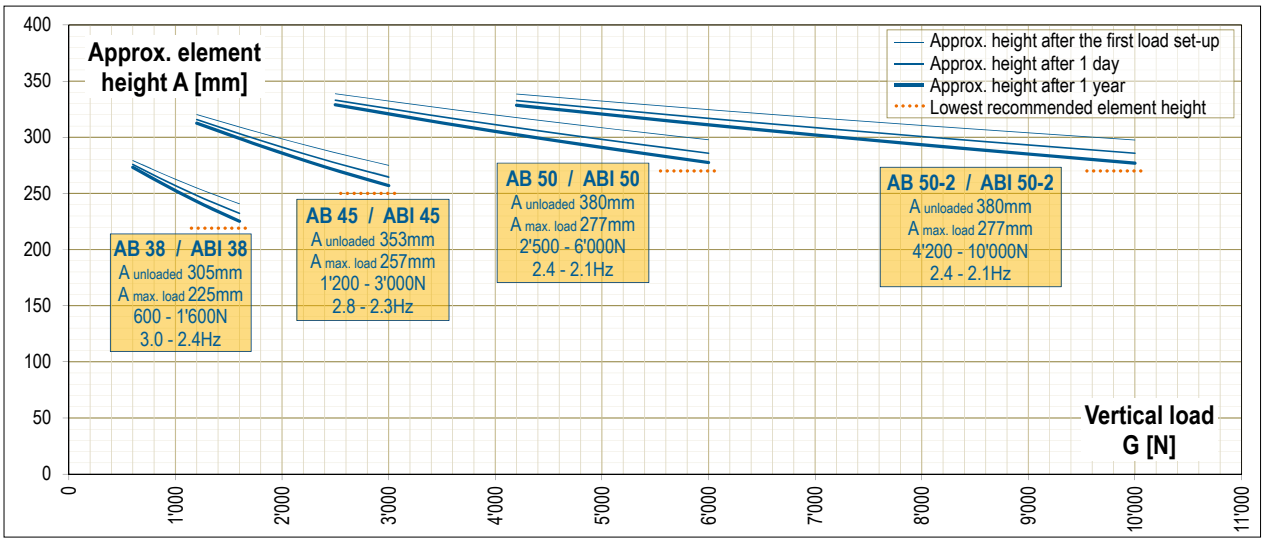


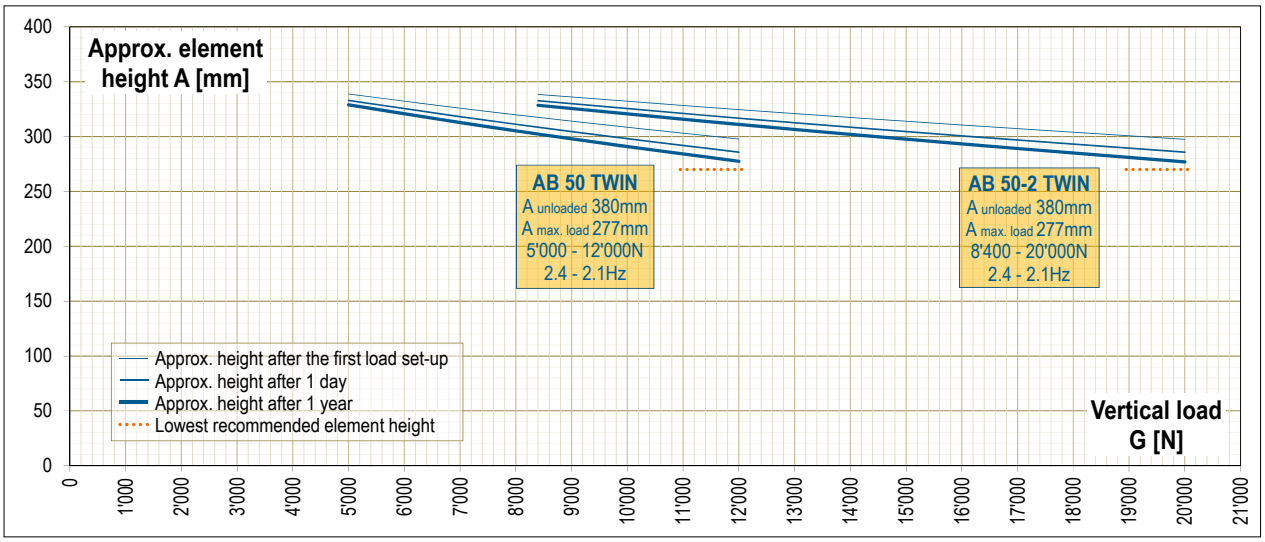
The mounting axis has to be arranged at a right angles (90°) to the conveying axis, with maximum tolerance of ±1°.

Oscillating mountings – free oscillating systems

Element heights and setting behaviour AB and ABI

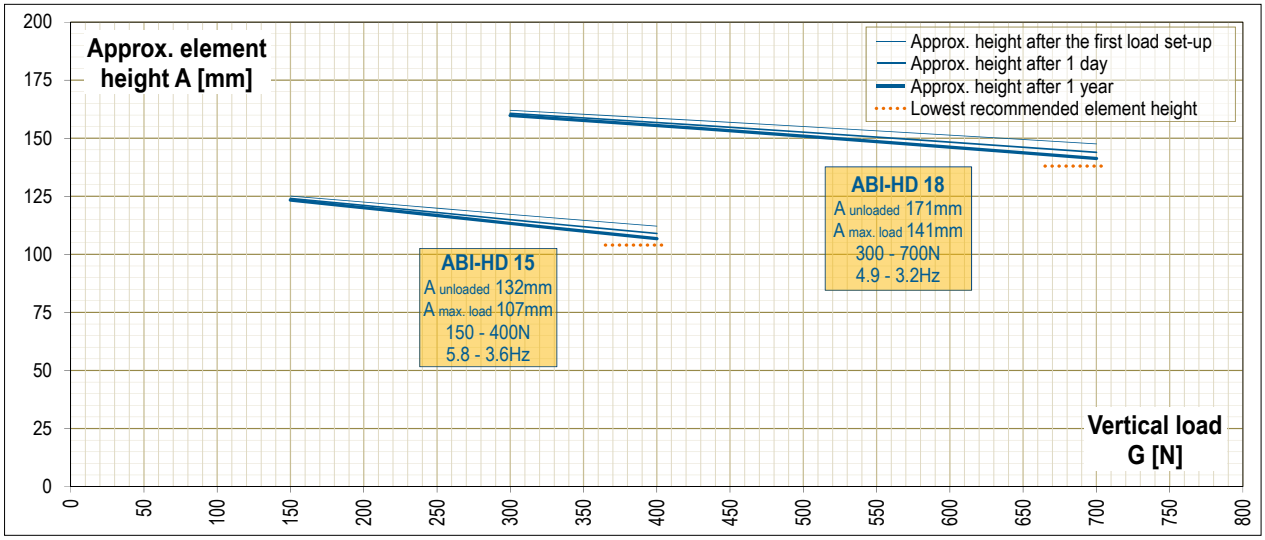


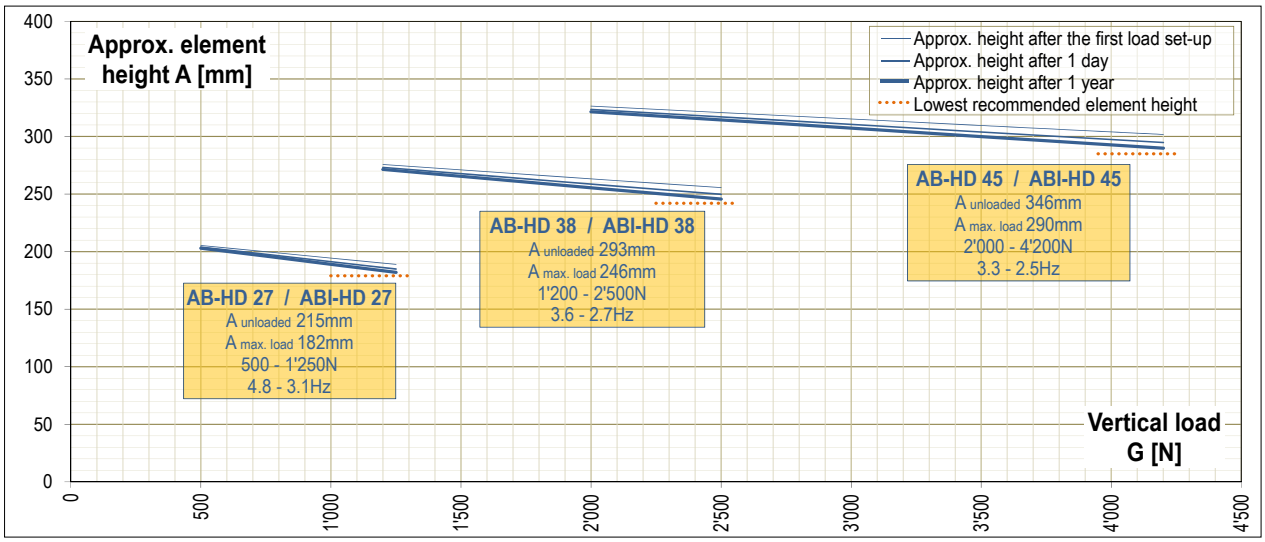


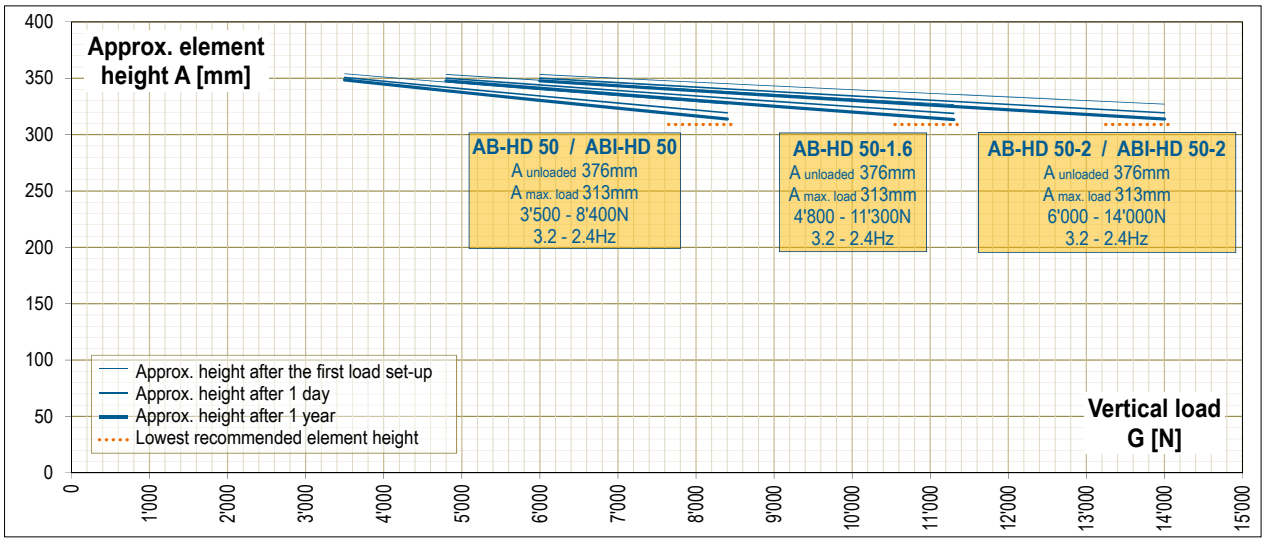


Oscillating mountings – free oscillating systems

Element heights and setting behaviour AB-HD and ABI-HD

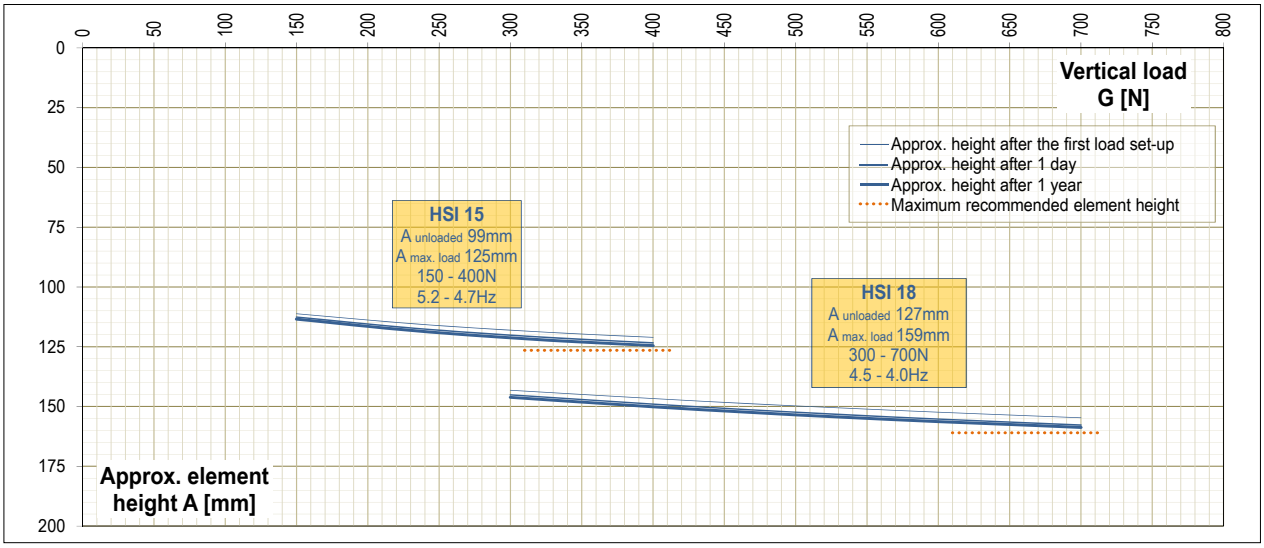


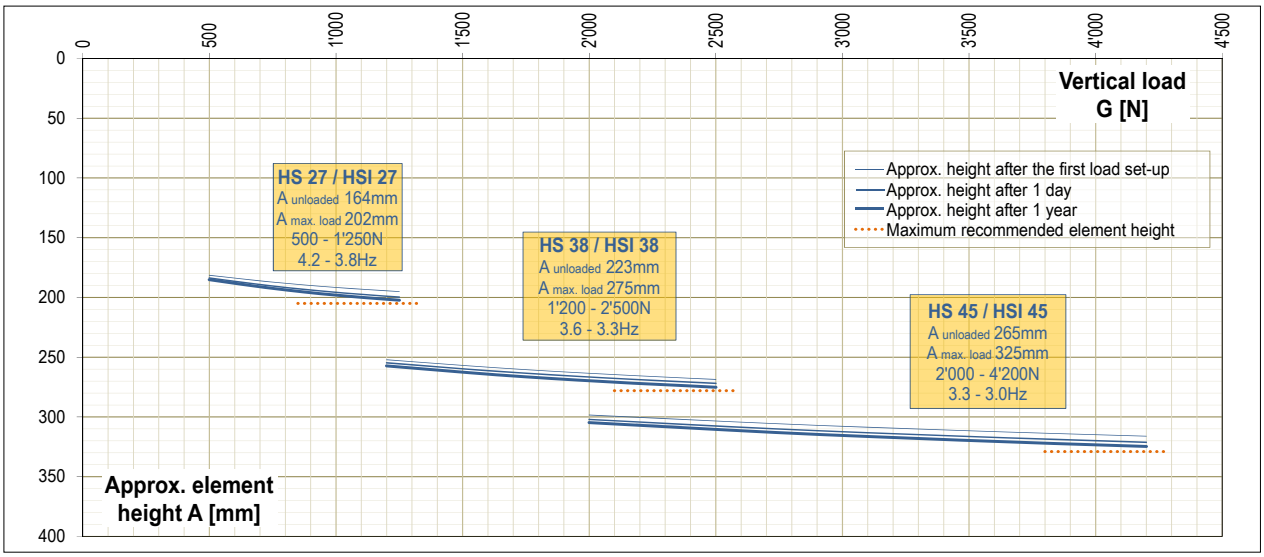


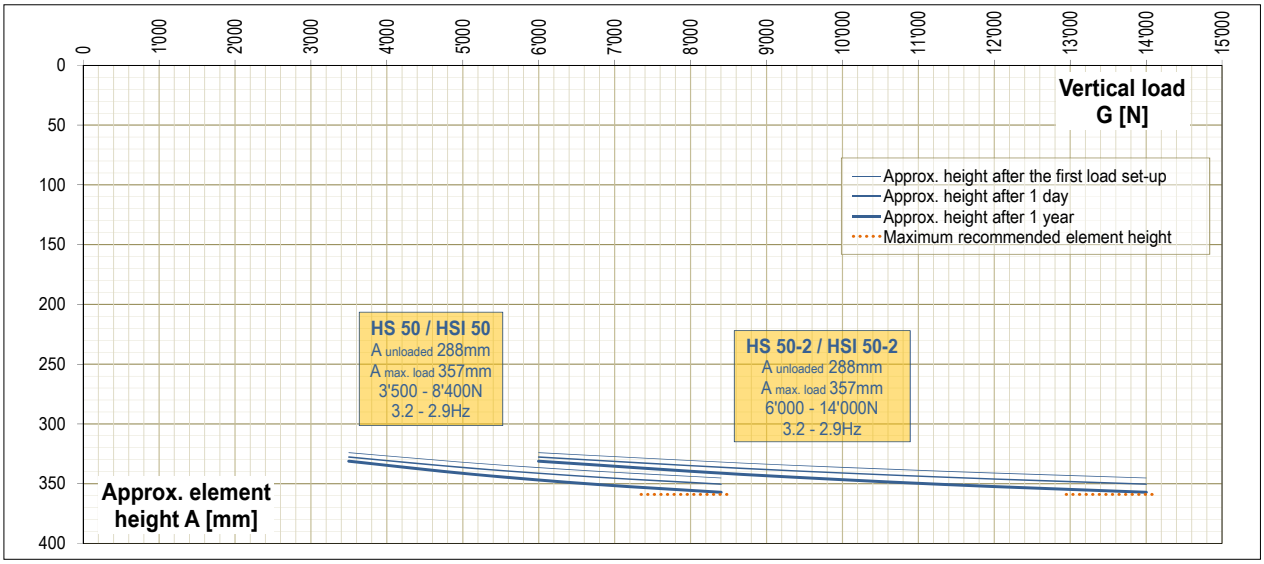


Oscillating mountings – free oscillating systems

Element heights and setting behaviour HS and HSI

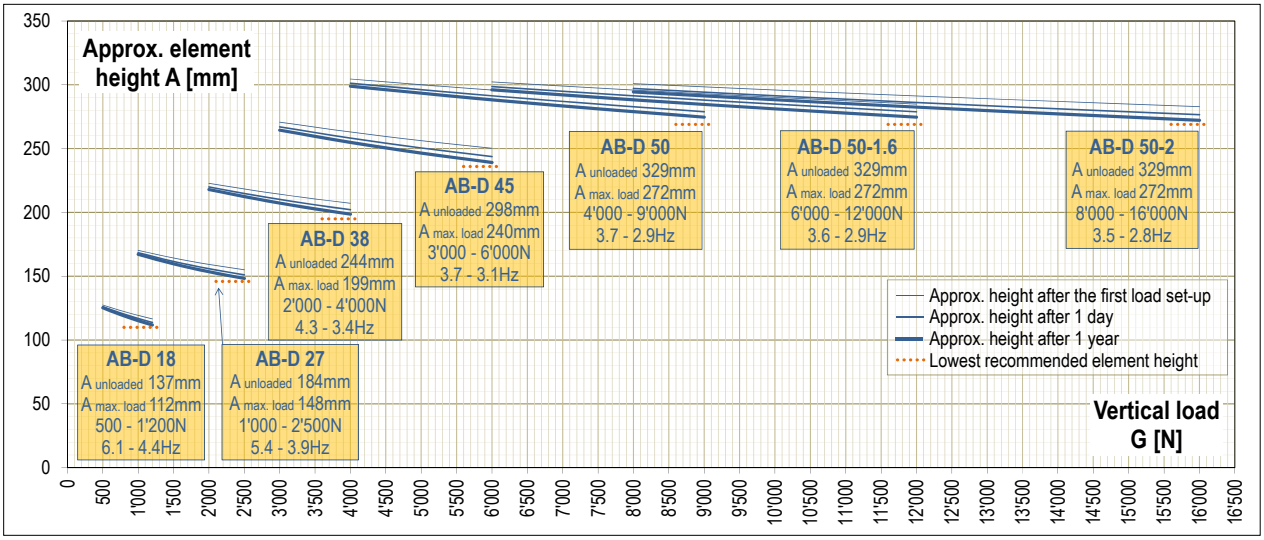






Oscillating mountings – free oscillating systems

Element heights and setting behaviour AB-D



Oscillating mountings – guided systems

One mass systems without spring accumulators: calculation

	Subject	Symbol	Unit
Length, weight	Weight empty trough *	m_0	kg
	Weight of feeding material *		kg
	Weight of oscillating mass	$m = m_0 + m_m$	kg
Drive parameter	Eccentric radius	R	mm
	Stroke	$sw = 2 \cdot R$	mm
	Rpm on trough	n_s	min^{-1}
	Gravity acceleration	g	9.81 m/s^2
	Oscillating machine factor	K	
	Acceleration	$a = K \cdot g$	m/s^2
	Total spring value of system	c_t	N/mm
Rocker arms	Quantity of rockers **	z	
	Load per rocker	G	N
	Center distance of elements	A	mm
Drive	Acceleration force	F	N
	Drive capacity approx.	P	kW
Spring value of natural frequency shaker	Dynamic torque	Md_d	Nm/°
	Dynamic spring value per rocker	c_d	N/mm
	Dynamic spring value of all rockers	$z \cdot c_d$	N/mm
	Resonant ability factor	i	

* When determining the weight, take into account:
– High coupling factor or sticking of wet and humid material
– Possible stemming of the trough

** Distance of the rocker max. 1.5 metres.

Calculation formulas

Oscillating machine factor

$$K = \frac{\left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot R}{g \cdot 1000} = \frac{n_s^2 \cdot R}{894'500} [-]$$

Total spring value of system

$$c_t = m \cdot \left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot 0.001 \quad [N/mm]$$

Load per rocker

$$G = \frac{m \cdot g}{z} \quad [N]$$

Acceleration force (for ST selection)

$$F = m \cdot R \cdot \left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot 0.001 = c_t \cdot R \; [N]$$

Drive capacity approx.

$$P = \frac{F \cdot R \cdot n_s}{9550 \cdot 1000 \cdot \sqrt{2}} \quad [kW]$$

Dynamic spring value per rocker

$$c_d = \frac{Md_d \cdot 360 \cdot 1000}{A^2 \cdot \pi} \quad [N/mm]$$

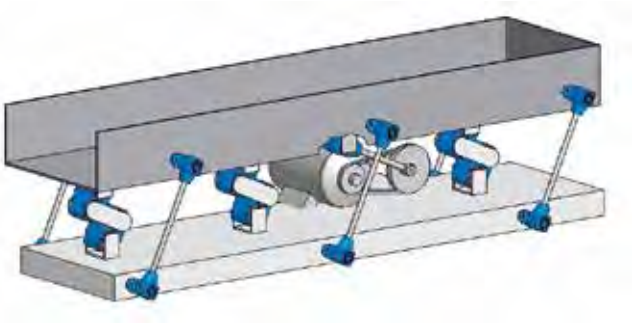
Resonant ability factor

$$i = \frac{z \cdot c_d}{c_t} [-]$$

By a resonant ability factor $i \geq 0{,}8$ the system is usually titled «natural frequency shaker».

Oscillating mountings – guided systems

One mass system with spring accumulators: calculation



Calculation analog one mass systems without spring accumulators with following additions:

	Subject	Symbol	Unit
Spring accumulators	Quantity	z_s	
	Dynamic spring value per item	c_s	N/mm
	Dynamic spring value of all items	$z_s \cdot c_s$	N/mm
	Resonant ability factor	i_s	

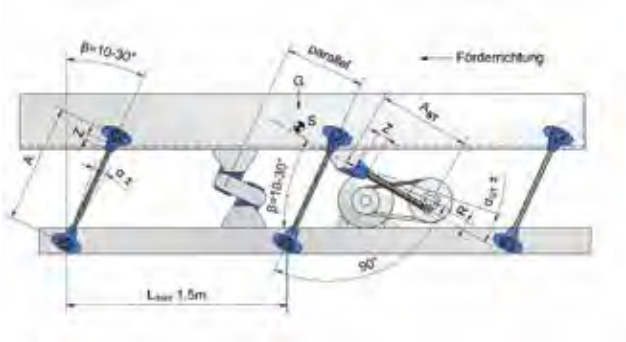
Calculation formulas

Resonant ability factor with accumulators

$$i_s = \frac{z \cdot c_d + z_s \cdot c_s}{c_t} [-]$$

By a resonant ability factor is ≥ 0.8 the system is usually titled «natural frequency shaker».

One mass conveyor system: installation instructions



Distance between rockers L_{max}:
– Usually, the distance between the rockers in the longitudinal direction must not exceed 1.5 metres.
– With chutes wider than 1.5 m, we recommend fitting a third row or multiple rows of rockers on the underside of the chute base or to install spring accumulators to improve the stability.

Mounting position drive head ST:
For one mass shaker systems it is recommendable to position the drive head slightly ahead of the center of gravity of the trough, towards the discharge end.

Angle of attack β:
The angle of attack β of the rocker must be between 10° and 30° to the perpendicular line, depending on the process and the conveying speed. (The optimum combination of a fast conveying speed and the high material throw is given at the angle of attack β = 30°.) The operating direction of the drive rod should be at 90°, i.e. the thrust angle of attack β is accordingly between 10° and 30° to the horizontal line.

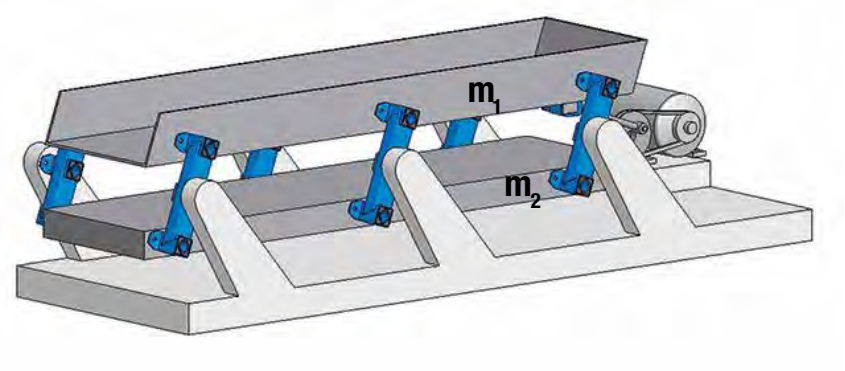
Oscillation angle α:
The parameters for the oscillation angle and speed must be within the permissible range, see «permissible frequencies» in chapter 7 Technology.

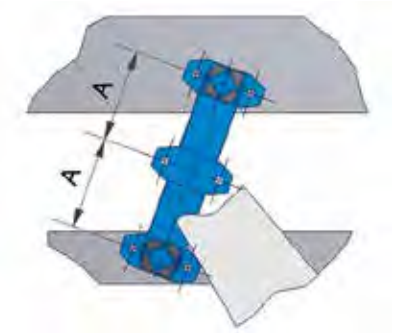
Screw grade:
Select screw grade 8.8 and mount with correct tightening torque.

Thread length Z:
The thread length Z is at least 1.5 × the nominal thread size.

Oscillating mountings – guided systems

Two mass system with direct mass balance





– Max. acceleration of approx. 5 g and max. chute length of approx. 25 metres
– Double rockers made from ROSTA elements AR, AD-P or AD-C
– Optimal balance of forces with $m_1 = m_2$
– Calculation same as for one mass system, with the following difference:

Actuated mass incl. material coupling	m_1 [kg]
Driven mass incl. material coupling	m_2 [kg]
Total oscillating mass	$m = m_1 + m_2$ [kg]

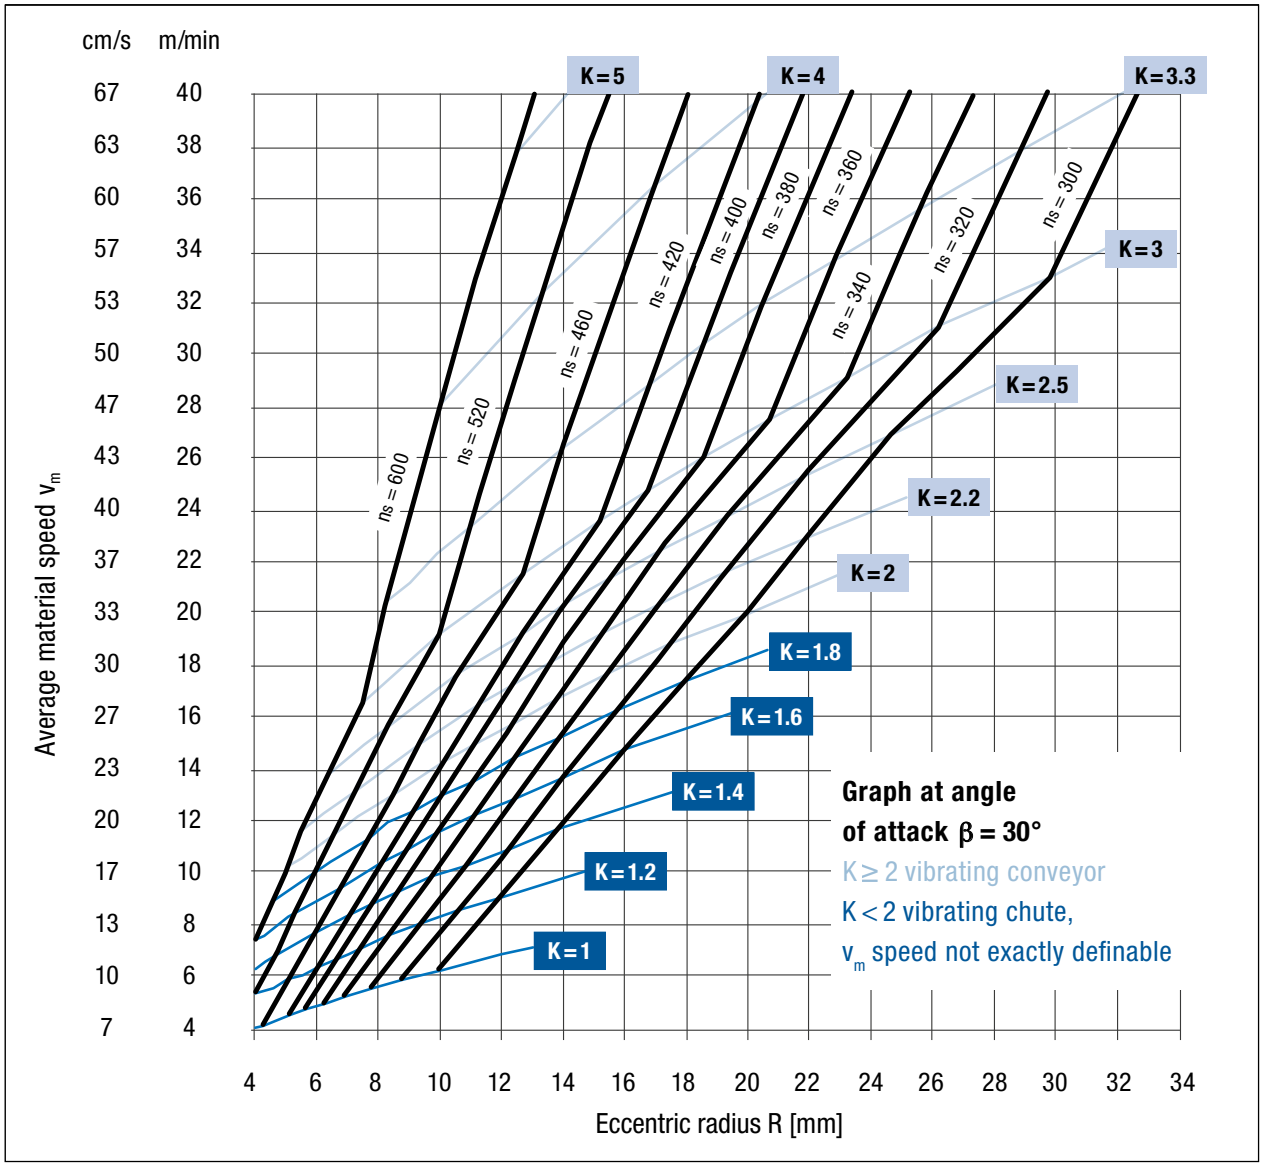
Dynamic spring value per rocker [N/mm]

$$c_d = \frac{3 \cdot Md_d \cdot 360 \cdot 1000}{2 \cdot A^2 \cdot \pi} \quad [N/mm]$$

– Calculation of c_t and F with the new total oscillating mass m
– Introduction of force with the ST at any point along the chute, 90° to the rocker axis
– For customised rockers with different centre distances A, please contact ROSTA

Oscillating mountings – guided systems

Average material conveying speed v_m



Main influence factors:
– bulk height
– sieve surface texture
– drive angle and thus rocker angle of attack
– feeding capacitiy is dependent on shape and humidity of the material, e.g. dry, fine-grained material needs correction factors up to 30 %.

By acceleration factors K > 2 and rocker mounting angles of β = 30° (to the perpendicular line) the vertical acceleration is getting bigger than 1 g, therefore the material starts lifting from the trough bottom = material throw.

Oscillating mountings – guided systems

Maximum load G, speed n_s and oscillation angle α

Size (e. g. AU 15)	max. load capacity per rocker [N]				max. revolutions n_s [min^{-1}] *	
	K < 2	K = 2	K = 3	K = 4	$\alpha \pm 5°$	$\alpha \pm 6°$
15	100	75	60	50	640	480
18	200	150	120	100	600	450
27	400	300	240	200	560	420
38	800	600	500	400	530	390
45	1600	1200	1000	800	500	360
50	2500	1800	1500	1200	470	340
60	5000	3600	3000	2400	440	320

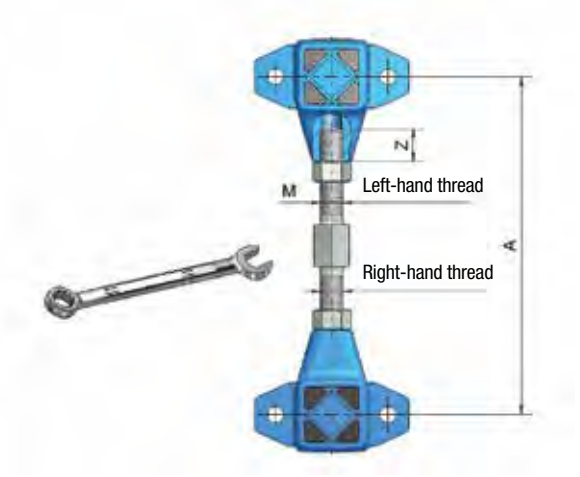
Please contact ROSTA for higher machine parameters and elements with greater loads.
The revolutions are usually $n_s = 300$ to 600 min^{-1} and oscillation angle α to max. $\pm 6°$.
*see «permissible frequencies» in chapter 7 Technology.

The oscillation angle α of each component must be within the permissible range of application (n_s and α), i. e. rockers, drive rods and spring accumulator.

Calculating the oscillation angle for rockers
Eccentric radius R [mm]
Center distance A [mm]
Oscillation angle $\alpha \pm$ [°]

$$\alpha = \arctan\left(\frac{R}{A}\right) [°]$$

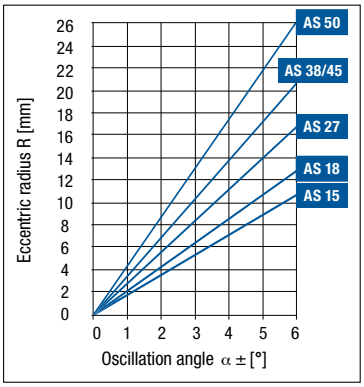
AU / AUI: Connection rod



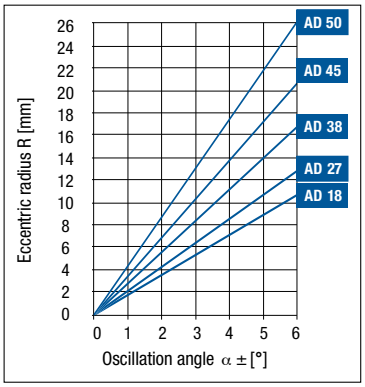
The customer manufactures the connection rod, preferably with a left and right-hand thread. Together with the corresponding oscillating mountings, the distance between the mountings (A) can be freely adjusted. Using a standard threaded rod (with «only» a right-hand thread) may be more economical, but it is less accurate.
The centre distance A must be set identically for all rockers and the thread length Z must be at least 1.5 × M.

AS / AD: Resulting oscillation angle α from eccentric radius R

Single rocker AS



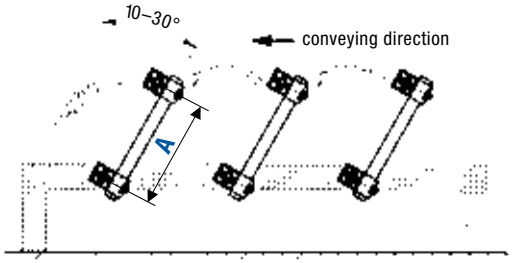
Double rocker AD



Oscillating mountings – guided systems

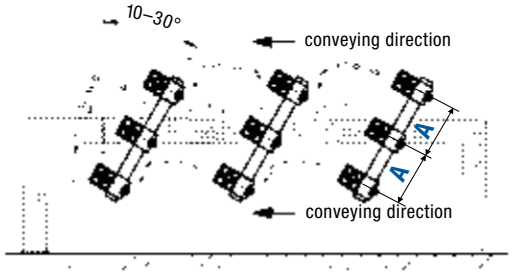
AR: Single, double and two-way Rocker

Single rocker



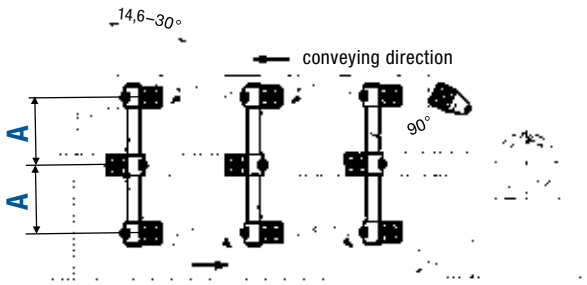
The two AR elements are pushed onto a round tube. The desired center distance is set on a straightening plate and then fixed by tightening the clamp.

Double rocker



With three AR elements, the tube wall thickness is adjusted to the centre distances A, see «dimensioning of the connecting tubes». The counterweight can be used as an additional conveyor trough with the same conveying direction.

Two-way rocker



The three AR elements mounted in the boomerang configuration create a two-way material flow. Tube wall thickness according to «dimensioning of the connecting tubes». This two-way conveying flow can simplify the conveying process and the mass balance is maintained with this arrangement.

AR: Dimensioning of the connecting tubes

For double rockers and two-way rocker

Type	Tube-ø	thickness of tube	max. centre distance A	resulting min. angle of attack β [°] with two-way rocker
AR 27	30	3	160	26.0
		4	220	19.5
		5	300	14.6
AR 38	40	3	200	27.5
		4	250	22.6
		5	300	19.1
AR 45	50	5	300	23.4
		8	400	18.0

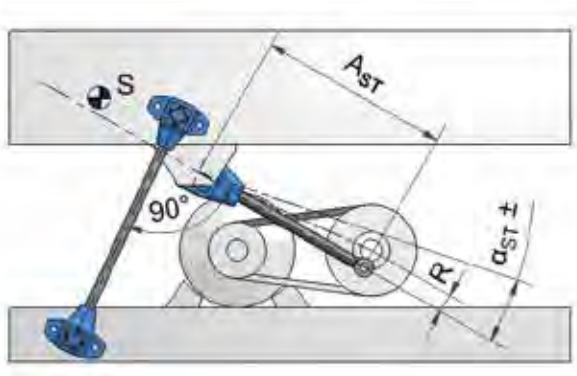
The customer provides the connecting tubes.

For single rockers with AR 27 or AR 38, it is sufficient for the tubes to have a wall thickness of 3 mm up to A = 300 mm.

For different centre distances A, please contact ROSTA.

Oscillating mountings – guided systems

ST / STI: Length of drive rod A_{ST} and eccentric radius R



To introduce the force in balance, the deflection angle α_{ST} of the drive rod must not exceed ±5.7°. This corresponds to a ratio R : A_{ST} of 1:10.

Calculation deflection angle

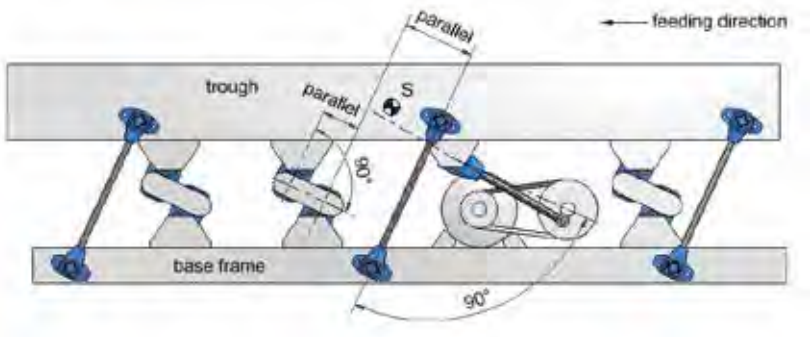
Eccentric radius R [mm]
Center distance A_{ST} [mm]
Deflection angle α_{ST} ± [°]

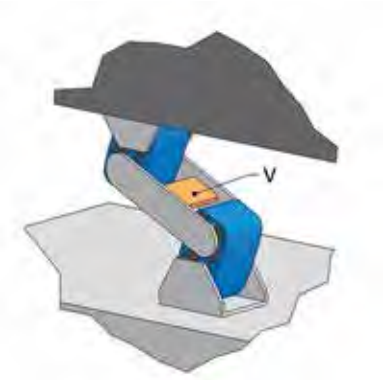
$$\alpha_{ST} = \arcsin\left(\frac{R}{A_{ST}}\right) [°]$$

DO-A: Operating parameters and installation guidelines

Example deflection angle DO-A (series connection)	Accumulator cons. of 2 × DO-A 45				Accumulator cons. of 2 × DO-A 50			
	R	sw	max. n_s	max. K	**R**	sw	max. n_s	max. K
±6°	**15.3**	30.6	360	2.2	**16.4**	32.8	340	2.1
±5°	**12.8**	25.6	500	3.6	**13.6**	27.2	470	3.4
±4°	**10.2**	20.4	740	6.2	**10.9**	21.8	700	6

The connecting levers made by the customer, between the DO-A elements, are at 90° to the DO-A element axis. A cross bracing can be installed installed (V) if required. The DO-A elements are parallel to each other and parallel to the rockers; they are attached by means of a fork construction at a rigid point on the vibrating conveyor and base frame.

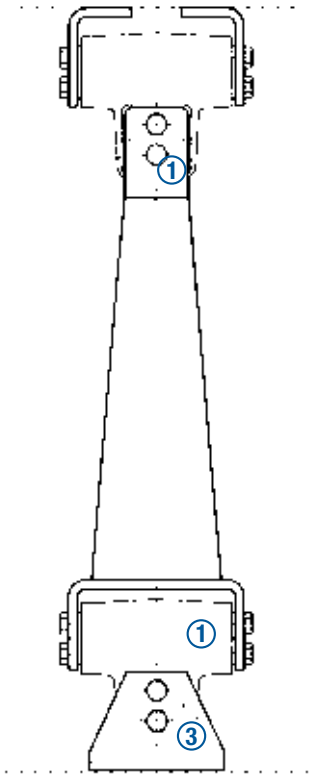


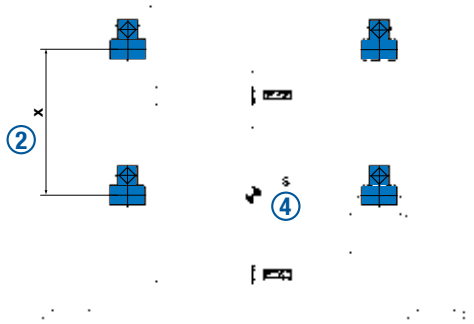


Oscillating mountings – gyratory sifters

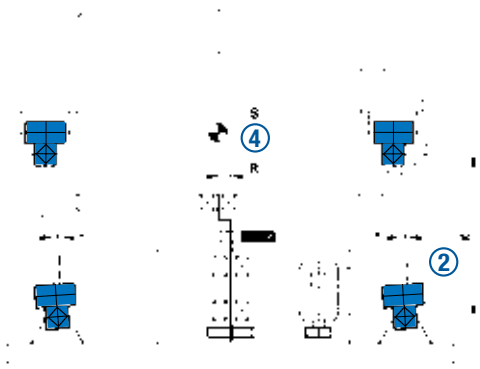
AK: Installation guidelines for gyratory sifters

1. Arrange the two inner elements offset by 90° (even torsional load).
2. Connect the AK, adjust the installation height. Even when the sifters are at an angle, the column height «X» must be identical.
3. Angle supports type WS can be used up to AK 50 (see chapter 2 rubber suspension elements).
4. To avoid unwanted tilting and turning, the screen box's centre of gravity «S» is positioned on or within the universal joint column.





Hanging and freely oscillating gyratory sifter



Standing gyratory sifter with positive crank shaft drive

AK: Calulation for gyratory sifters

Machine type: standing gyratory sifter with positive crank drive

Description	Symbol	Unit	Calculation formula
Total oscillating mass (material included)	m	kg	**Oscillation angle**
Eccentric radius	R	mm	$\alpha = \arctan\left(\frac{R}{X}\right)$ [°]
Length of support column	X	mm	
Oscillation angle (out of R and X)	$\alpha\pm$	°	
Quantity of support columns	z	pcs.	**Load per column**
Load per column	G	N	$G = \frac{m \cdot g}{z}$ [N]

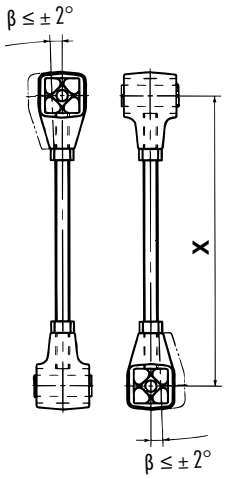
Limitation of application parameters see «permissible frequencies» in chapter 7 Technology.

Oscillating mountings – gyratory sifters

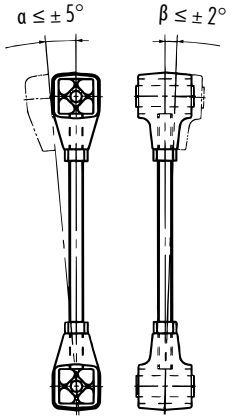
AV: Installation guidelines for gyratory sifters

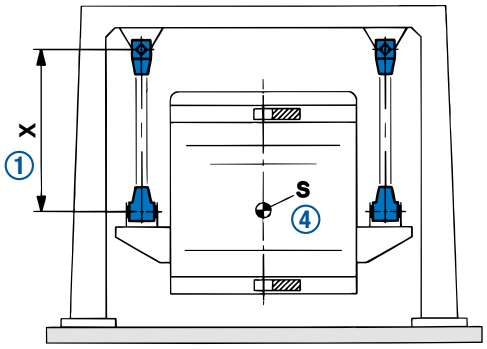
1. With the right-hand and left-hand threaded versions, the length X of the suspension rod can easily be adjusted. X has to be identical for all columns and the specified angle limitations must be respected!
2. Installing the two elements in a crosswise configuration moves the gyratory sifter in a circular motion.
3. Installing the two elements in the same configuration moves the gyratory sifter in an elliptical motion.
4. To avoid unwanted tilting or turning, the centre of gravity of the screen box «S» is positioned at the same level or slightly below the suspension rod's attachment.
5. Please consult ROSTA in the selection of AV elements for standing gyratory sifters.

② circular oscillation



③ elliptical oscillation





AV: Calculation for gyratory sifters

Description	Symbol	Unit	Calculation formula
Total oscillating mass (material included)	m	kg	**Oscillation angle**
Eccentric radius ②	R	mm	$\beta = \arctan\left(\frac{R}{X}\right)$ [°]
Length of suspension rod	X	mm	
Oscillation angle (out of R and X), shall not exceed ±2° ②	β ±	°	
Quantity of suspension rods	z	pcs.	**Load per suspension rod**
Load per suspension rod	G	N	$G = \frac{m \cdot g}{z}$ [N]

Limitation of application parameters see «permissible frequencies» in chapter 7 Technology.
