INTRODUCTION TO OPEN-END BELTS

Megadyne commenced manufacturing transmission belts in 1957 and extruding open end belts in 1975. Megalinear open length belts are manufactured in thermoplastic polyurethane, that gives superior wear and abrasion resistance. Various grade of steel cords offer good running characteristics even with high tractive load.

Great production flexibility grant to designers possibility to match any technical requirement and solution.

By selecting different components and material, Megalinear belts can be manufactured to meet every customer requirement.

Megalinear open-end belts are particularly suitable for application where accuracy of positioning, low noise and free-maintenance are requested.

Thanks to their features, Megalinear belts can be successfully used in a wide range of application such as:

- conveyors
- automatic sliding doors and garage opening system
- elevators
- automated handling devices
- linear drivers
- positioning system
- wood industry
- textile machine
- serigraphic industry
- glass industry
- stone and marble industry
- packaging industry
- robot systems
- tobacco industry
- paper and carton industry
- chemist and pharmaceutical industry

Megadyne has developed a very wide range of solutions with numerous tooth designs, tensile members and compound, suitable for all applications.

CLASSIFICATIONS

CLASSIFICATIONS

Megalinear Timing Belts are manufactured in thermoplastic polyurethane, with single parallel steel cords. This type of belts, developed by our Research & Development, offers good running characteristics and high traction loads. They are especially suited for power transmission and conveying with high loads and speeds. The addition of a nylon coating on the teeth during production enhances the running properties for specific applications and reduces the noise due to a lower frictional coefficient. An extra thickness of special coating is also possible on the back of the belt offering extra protection against aggressive or heavy products.

- 1) The body of the belts is white thermoplastic polyurethane 92 ShA, characterized by high levels of wear resistance even in the presence of shock and surge loading.
- 2) High strength S and Z parallel zinked steel tension members allow high breaking load and extremely low elongation. The combination of these high grade materials improves belt performances which can be summarised as follows:
 - exceptional resistance to abrasion and tooth shear
 - low coefficient of friction
 - high flexibility
 - ozone and temperature resistance (-25 °C / +80 °C)
 - oil, grease and gasoline resistance

MECHANICAL AND CHEMICAL CHARACTERISTICS

- Constant dimensions
- Noiseless
- Free maintenance
- High flexibility
- High resistance steel traction cords, with little stretching and top flexibility
- Linear speeds up to 70 m/s
- Low pretension
- Constant length
- High abrasion resistance
- Ageing, Hydrolysis, Ozone resistant
- Working temperature -25 °C / +80 °C
- High resistance to Oils, Greases and Gasoline
- Fairly Acid-proof and Alkali-proof

BODY

Megalinear belts are manufactured with white thermoplastic Polyurethane 92 ShA as standard.

Special compounds (different hardnesses, special properties) are available on request. Here under some PU characteristics:

Water	No problem in normal or sea clean water, at room temperature. Over 60 °C there is a fast decrement of breaking strength.
Acids	In acid diluted proportions, at room temperature, this PU is moderately attacked. In high concentration acid solutions, this PU has a very short lifespan. Over 50 °C, acids are always dangerous for Thermoplastic PU.
Alkalis	In alkalis diluted proportions, at room temperature, this PU is moderately attacked. In high concentration acid solutions, this PU has a very short lifespan. Over 50 °C, acids are always dangerous for Thermoplastic PU.
Solvents	Thermoplastic PU is insoluble in the greater part of solvents. Only the very polar solvents (same as tetrahydrofuran, dimethylformamide, n-methylpyrrolidone) can dissolve or tight damage PU. The Esters or the Ketons (same as ethyl acetate or methylethylketene) can usually produce a bulge, decreasing mechanical characteristics. The Hydrocarbons aromatic and the Hydrocarbons aliphatic produce very high bulge. All the effects increase by increasing temperature.
Oils	PU has a high resistance to mineral pure oils (lubrificants, engine oils, combustibile oils). Usually, high performance syntetic oils, due to special additives contained, can be incompa-

Greases	tible with Thermoplastic PU, especially at high temperature. PU has a high resistance to mineral pure greases (lubrificants greases). Usually, high performance syntetic greases, due to special additives contained, can be incompatible with Thermoplastic PU, especially at high temperature.
Fuels	Good resistance to petrols without Alcohols. In presence of Alcohols, Thermoplastic PU can suffer deterioration. Fuels including Aromatiche stuffs can produce reversible bulges.
Microorganisms	In presence of grime, containing humidity, Microorganisms can develop. In case that Microbic attack can produce danger, you have to use a special kind of PU.
Weather agents	Good resistance to atmospheric agents. White colour can change to light yellow under long UV exposure. In any case this hasn't influence on mechanical resistance.

CORDS

Standard cord Kevlar	Megalinear is manufactured with S and Z parallel zinked steel cords as standard. Kevlar tension cords are suggested for: <ul style="list-style-type: none"> • Non magnetic, for use in drives with metal detectors • Widely used in the food industry
HP	High Performance cords have 25% more strength capacity than standard cords. They are recommended for high repeatability applications.
HF	High Flexibility cords can accept smaller pulley and idler diameters than standard cords. They are suitable for multi-shaft drives with severe reverse bending.
HPF	High Performance and Flexibility cords have 25% more strength capacity like the HP cords, but they are more flexible than the HP cords. They are suggested for high performance and multi-shaft drives.
Stainless steel	Stainless steel cords have 25% less strength capacity than standard cords. They are recommended for water applications.

COATING

Megalinear can be manufactured with special coating on the teeth or on the back. Please check on page 90 and 91.

IDENTIFICATION CODE

Using the information in the table below, it is possible to identify the correct belt for every application. The code is composed of letters and numbers as the following example:

1	2	3	4	5	6					
J	+	50	+	AT	+	10	+	10000	+	SPECIAL MANUFACTURES

- 1) **J** joined belt.
ML Megalinear belt open-end.
- 2) **50** this number indicates the width of requested belt. The value is in mm for a belt with a pitch in mm, and in inches for a belt with a pitch in inches.
- 3) **AT** this code composed by letters indicates the selection of profile.
- 4) **10** this number indicates the standard pitch of the belt. It is expressed in mm.
- 5) **10000** the last number indicates the length of the belt always in mm regardless of pitch.
- 6) **SPECIAL MANUFACTURES:**
 - special cords as Kevlar or HP or HF or HPF or stainless steel
 - special compound as different hardness 85 ShA or different colours (black - red - yellow - blue)
 - extra coating NFT or NFB or AVAFC or Tenax or Linatex or Honey comb or PU black cellulose or PU yellow or Neoprene rubber.

TECHNICAL CALCULATION

LINEAR MOTION BELT

OMEGA LINEAR MOTION BELT

CONVEYOR BELT

The following pages contain data, formulae and tables that are required to design a new belt drive. For critical and difficult drives, it is recommended that you contact your supplier's Technical Staff for advice.

Symbol	Unit	Definition	Symbol	Unit	Definition
a	m/s ²	acceleration	c	mm	centre distance
b	mm	belt width	g	m/s ²	gravity (9,81)
C_s	–	safety factor	μ	–	friction coefficient
ε_{1/100}	‰	elongation	m	Kg	conveyed mass
d	mm	idler pitch diameters	M_t	Nm	drive torque
d₁	mm	sprocket pitch diameter	n₁	1/min	revs/min (RPM) of drive sprocket 1
F_p	N	pretension	P	KW	drive power
F_u	N	peripheral force	Q	N	force exerted by mass (m)
F_{p spec}	N/cm	transmittable force per tooth per unit width	V	m/s	belt speed
MTL	N	max traction load	Z_i		number of teeth of sprocket
BS	N	breaking strength	Z_m		number of teeth in mesh on driver sprocket (12)

Max traction load is maximum acceptable traction on cords.
 Breaking strength is necessary load to break belt cords.
 Elongation is belt elongation under load.

USEFUL FORMULAE AND CONVERSION FACTORS

$$V = \frac{d_1 \cdot n_1}{19100} \quad n_1 = \frac{V \cdot 19100}{d_1} \quad d_1 = \frac{V \cdot 19100}{n_1} \quad Q = m \cdot g$$

$$P = \frac{M_t \cdot n_1}{9550} \quad M_t = \frac{9550 \cdot P}{n_1} \quad M_t = \frac{F_u \cdot d_1}{2000}$$

CHOICE OF BELT PITCH AND SPROCKETS

For optimum belt pitch see tables on page 12.

For optimum choice of sprocket size, it is desirable to have as near to 12 teeth in mesh as possible.

CALCULATION OF THE PERIPHERAL FORCE ON THE TIMING BELT

known mass	→ For horizontal & conveying drives	$F_u = (m \cdot a) + (m \cdot g \cdot \mu)$
	(Note: values of μ can be found in table 1 on page 13).	
	→ For vertical drives	$F_u = (m \cdot a) + (m \cdot g)$
known drive torque		$F_u = 2000 M_t / d_1$
known drive power		$F_u = 19.1 \cdot 10^6 \cdot P / (d_1 \cdot n_1)$

DETERMINATION OF THE BELT WIDTH

The belt width b should be calculated using the following formula

$$b = (F_u \cdot C_s \cdot 10) / (F_{p \text{ spec}} \cdot Z_m)$$

C_s = safety factor from page 13 table 4

F_u = from above calculation

Z_m = number of teeth in mesh on driver sprocket

$Z_m = Z_1 \cdot \text{arc of contact} / 360$

= (if calculated $Z_m \geq 12$ for an open-end application
use $Z_m = 12$)

= (if calculated $Z_m \geq 6$ for a joined application
use $Z_m = 6$)

$F_{p \text{ spec}}$ = transmittable force per tooth per unit width (see table on belt data pages)

PRE-TENSIONING

The suggested installation tension:

$F_p = 2 \cdot F_u$	for linear and omega linear movement applications
$F_p = F_u$	for conveyor applications

CORD CHECK

The maximum allowable tensile load of the belt pitch/width combination selected (see tables on belt data pages):

$$\text{max traction load of chosen belt} > \frac{F_p}{2} + (F_u \cdot C_s)$$

SPROCKET AND IDLER DIAMETER CHECK

Ensure that all selected pulley and idler diameters are equal to or greater than the minimum values specified in corresponding belt data page.

ELONGATION

When the belt is operating there will be an elongation proportional to max traction load:

$$\Delta l / l_0 = (F_u \cdot 4) / \text{max traction load}$$

LINEAR MOTION CALCULATION EXAMPLE (open-end belt)

MACHINE DATA

$C = 2.000 \text{ mm}$
 $d_1 = 76 \text{ mm}$
 $n_1 = 300 \text{ RPM}$
 $P = 1,8 \text{ KW}$
 low fluctuating load

CHOICE OF BELT PITCH AND SPROCKETS

According to the belt pitch selection table n.1 on page 12 considering the values of P and n_1 , we select RPP8 belt. Then we consider the pulley diameter nearest to the requested value and the corresponding n. of teeth (see technical information on page 59).

Therefore $Z_1 = 30$ teeth (with a pitch diameter of 76,4 mm).

CALCULATION OF THE EFFECTIVE TENSION

Since the drive power is known, F_u can be calculated

$$F_u = \frac{19,1 \cdot 10^6 \cdot P}{d_1 \cdot n_1} = \frac{19,1 \cdot 10^6 \cdot 1,8}{76,4 \cdot 300} = 1500 \text{ N}$$

DETERMINATION OF THE BELT WIDTH

$$b = \frac{F_u \cdot C_s \cdot 10}{F_{p \text{ spec}} \cdot Z_m}$$

$$b = \frac{1500 \cdot 1,4 \cdot 10}{62 \cdot 12} = 28,2 \text{ mm}$$

F_u = from before (1500 N)

C_s = from page 13 table 4, for low fluctuating load $C_s = 1,4$

Z_m = given that driver pulley has 30 teeth and angle of belt wrap is 180 degrees n. of teeth in mesh = 15.

But due to max Z_m is 12. Then $Z_m = 12$

$n_1 = 300 \text{ RPM}$ (given)

$F_{p \text{ spec}} = 62 \text{ N / cm}$ (refer page 58 at 300 RPM)

Since the next closest width is 30 mm: 30 RPP8 is chosen.

PRE-TENSIONING

$$F_p = 2 \cdot F_u \quad F_p = 3000 \text{ N}$$

CORD CHECK

From page 54, RPP8 pitch 30 mm wide: max traction load 4510 N

$$\text{max traction load} > \frac{F_p}{2} + (F_u \cdot C_s) \quad \frac{F_p}{2} + (F_u \cdot C_s) = 1500 + 1500 \cdot 1,4$$

4510 N > 3600 N selected belt is acceptable.

SPROCKET AND IDLER DIAMETER CHECK

Ensure that all selected pulley and idler diameters are greater than or equal the minimum values specified on page 59.

ELONGATION

$$\Delta l_{/00} = \frac{F_u \cdot 4}{\text{max traction load}} = \frac{1500 \cdot 4}{4510} = 1,33 \text{ mm/m}$$

In the dynamic situations you will have an elongation of 1,33 mm per meter of operating belt.

MACHINE DATA

$C = 5.000 \text{ mm}$
 $d_1 = 100 \text{ mm}$
 $V = 0,5 \text{ m/s}$
 $a = 0,5 \text{ m/s}^2$
 Guide in nylon
 $Q = 7000 \text{ N}$
 low fluctuating load

CALCULATION OF THE EFFECTIVE TENSION

Since the mass is known, F_u can be calculated $F_u = (m \cdot a) + (m \cdot g \cdot \mu)$ value of μ according to table 3 on page 13 = 0,35

$F_u = (714 \cdot 0,5) + (714 \cdot 9,81 \cdot 0,35) = 2808 \text{ N}$
 $m = Q/g = 7000 / 9,81 = 714 \text{ kg}$

CHOICE OF BELT PITCH AND SPROCKETS

According to the belt selection table n. 2 on page 12, considering the values of F_u (for joined belts enter double of calculated F_u in table 2), we select AT 10. Then we consider the pulley diameter nearest to the requested value and the corresponding n. of teeth (see technical information page 43). Therefore $Z_1 = 32$ teeth (with a pitch diameter of 101,86 mm).

DETERMINATION OF THE BELT WIDTH

$$b = \frac{F_u \cdot C_s \cdot 10}{F_{p \text{ spec}} \cdot Z_m}$$

$$b = \frac{2808 \cdot 1,4 \cdot 10}{69 \cdot 6} = 94,95 \text{ mm}$$

$F_u =$ from before (2808 N)
 $C_s =$ from page 13 table 4, for low fluctuating load $C_s = 1,4$
 $Z_m =$ given that driver pulley has 32 teeth and angle of belt wrap is 180 degrees, n. of teeth in mesh = 16. But, max Z_m for joined belt is 6. Hence, $Z_m = 6$
 $n_1 = (V_p \cdot 60.000) / (\xi \cdot d_1)$
 $= (0,5 \cdot 60.000) / (\xi \cdot 101,86)$ as $d_1 = 101,86$ from before
 $= 99 \text{ RPM}$
 $F_{p \text{ spec}} = 69 \text{ N / cm}$ (refer page 42, at 100 RPM)

Since the next closest width is 100 mm: 100 AT10 is chosen.

PRE-TENSIONING

$$F_p = F_u \text{ so } F_p = 2808 \text{ N}$$

CORD CHECK

From page 40, AT10 pitch 100 mm wide joined: max traction load 8312,5 N

$$\text{max traction load} > \frac{F_p}{2} + (F_u \cdot C_s) \quad \frac{F_p}{2} + (F_u \cdot C_s) = \frac{2808}{2} + (2808 \cdot 1,4)$$

8312,5 N > 5335 N selected belt is acceptable.

SPROCKET AND IDLER DIAMETER CHECK

Checking technical data on page 43 for pulley and idlers, it can be seen that the drive has acceptable pulley diameters.

ELONGATION

$$\Delta l_{/00} = \frac{F_u \cdot 4}{\text{max traction load}} = \frac{2808 \cdot 4}{8312,5} = 1,35 \text{ mm/m}$$

In the dynamic situations you will have an elongation of 1,35 mm per meter of operating belt.

CALCULATION PARAMETERS

BELT PITCH SELECTION

Table n.1

BELT WIDTH SELECTION

Table n.2

Table n. 3 - Friction coefficient

Rolling friction on dry surface	
Polyurethane / smooth steel	$\mu = 0.5$
Polyurethane / rough steel	$\mu = 0.7$
Polyurethane / abrasive steel	$\mu = 0.9$
Polyurethane NFT / smooth steel	$\mu = 0.25$
Polyurethane NFT / rough steel	$\mu = 0.35$
Polyurethane NFT / abrasive steel	$\mu = 0.6$
Polyurethane / nylon	$\mu = 0.35$

apron bucket, elevator		1.8
screw		1.8
Brick machinery		1.8

BELT INSTALLATION

A major difficulty installing transmission belt is to achieve correct belt tension. Lifetime of support bearings and transmission belts and therefore reliability of the complete system largely depends on an optimally adjusted belt tension. Pretension is the force needed to put tension into the system to avoid the belt jumping on the pulleys as in the example below:

For a correct system installation, all applications with Megalineer belt can be summarised according following two sketches:

1) Linear and omega linear motion belt

2) Conveyor belt

F_p = pretension
 F_u = peripheral force (see calculation pag. 8/9)
 r = pulley radius

PROCEDURE TO MEASURE

The procedure to measure the tension of the belt is to use a Belt Tension Gauging Equipement. This device consists of a small sensing head which is held across the belt to be measured. The belt is then tapped to induce the belt to vibrate at its natural frequency. The vibrations are detected and the frequency of vibration is then displayed on the measuring unit.

The relation between belt static tension (T_s) and frequency of vibration (f) may be calculated using the following formula:

$$f = \frac{1}{2t} \cdot \sqrt{\frac{T_s}{m}} \quad \text{or} \quad T_s = 4 \cdot m \cdot t^2 \cdot f^2 \quad (16)$$

Where:

T_s = Static tension (N)

f = Frequency of vibration in Hertz (Hz)

m = Belt mass per unit length (kg/m)

t = Free belt span length in meters (m)

For a correct system functioning and to increase belt life, it is necessary a correct pulley installation: pulleys has to be parallel and aligned as shown in drawing 1 (correct configuration).

If pulleys are not parallel as in drawing 2, belt could fall during functioning and this can provoke damages to complete equipment.

To grant a correct belt running, configuration according drawing 3 has to be avoided.

In omega application to grant good mesh between pulley and teeth and to respect belt flexibility avoiding excessive stress on cords, distance d (as drawing 4) has to be:

$d = 4 \cdot \text{belt width}$
Suggested angle 120°

Moreover for a good drive work, it is suggested to check belt straightness as follows:

Belt width	Testing belt length	Maximum suggested bending (A)
Till to 20 mm	1 m	3 mm
Over 20 mm	2 m	4 mm

FIXING PLATES

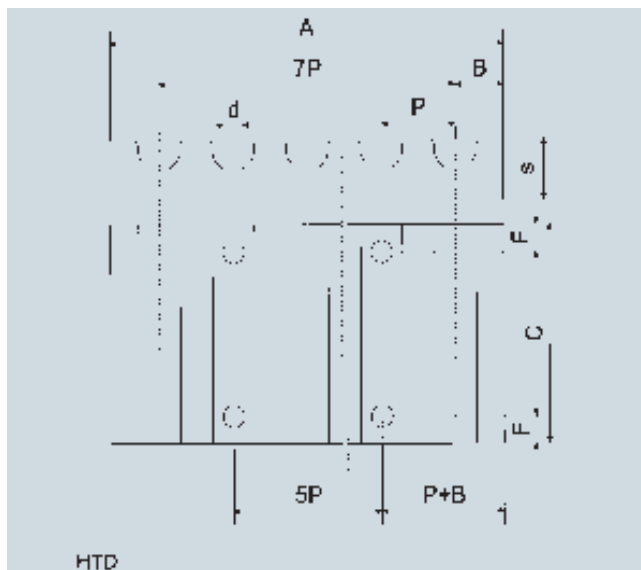

The fixing plates are used to fix the tail of the open belts.

On the customer's request, the plates can be delivered with or without fixing holes.

As the belt can't be stretched with the fixing plates we suggest to use other tension system.

The plates are delivered in aluminium alloy.

The Megadyne Technical Staff is ready to study special or particular applications.

Order code example: AT10 pitch clamping plate for 25 mm width belt

Clamping plates for imperial pitch belts							Belt width (inches)

• Available in customized length

Engagement between teeth and pulley tooth space is important for positioning precision and transmission synchronism.

Standard engagement

It is possible to use pulley with "zero" back lash to reduce positioning mistakes, in such case belt and pulley tooth edges are in touch cancelling lash between these two elements. In any case, in application with high loads, a certain lash will always occur due to belt tooth deformation.

Transmission with "zero" back lash has always to be widely oversized to contrast belt elongation on free tensioned span.

"Zero" back lash engagement

MAXIMUM RECOMMENDED PULLEY'S TEETH:
 Till 100 1/min Z = 40
 Till 500 1/min Z = 30
 Till 1000 1/min Z = 20
 Till 500 1/min Z = 10
 OVER NOT RECOMMENDED

In following table you can find list of available "zero" back lash pulleys and average value for back lash:

Available pitch for "zero" back lash pulley	T5	T10	T20	AT5	AT10	AT20
Average back lash value for standard	+/-0.3	+/-0.6	+/-1.2	+/-0.1	+/-0.2	+/-0.4

All not-mentioned pitches are not available in "zero" back lash version.

RPP belts and pulleys in standard version offer a great solution for positioning system because their parabolic profile reduces interference and improves meshing characteristics.

CLEATS

Megadyne timing belts can be customised with profiles vulcanised on the backside. All the cleats are made using the same thermoplastic polyurethane as the MEGALINEAR body (*white PU 92 ShA*).

The profiles are attached with the best technology now available, the High Vibration System.

The production process for these profiles is very flexible; Megadyne can design any profile to meet the specific requirement of the customer, in order to check and develop all the needed special profiles.

STANDARD PARALLELEPIPED PROFILES

Megadyne can produce, as standard cleats, the parallelepiped profiles, starting from a thermoplastic polyurethane strip roll and cutting until the requested profile dimension.

The t value (thickness) is available from 2 until 13 mm, the h value (height) can be from 3 until 120 mm and the width can be 150 mm maximum.

Megadyne recommend that the profile spacing were multiple of the belt pitch; in any case, for special inquiries and small quantities, it is possible to weld the profiles also in others positions; the feasible dimensions, with the standard process tolerances, are introduced in the following sketch.

The tolerances on the position are ± 0.5 mm.

The cumulative tolerance on the spacing of the profiles is the same of the length tolerance for our standard belts (± 0.8 mm/m) (tighter tolerances are available on request).

Due to the welding process, a bead of material develops at the meeting point of profile and belt.

In any case, Megadyne always remove this welding bead.

PROFILE MECHANICAL RESISTANCE

In order to find the right cleat dimensions, please consider the following factors:

- Section base cleats resistance (**R**) becomes bigger, increasing:
 - cleats width (**w**)
 - cleats thickness (**t**)

- Cleat stiffness is bigger:
 - increasing cleat thickness (**t**)
 - using special moulded profiles, like STDE0006, STDE0008, STDE0010 and STM10012 types

MIN. N° OF PULLEY TEETH FOR BELTS WITH PROFILES

The profiles presence can change the belt flexibility properties; the two factors that affect the original flexibility are the following:

- thickness of the cleat "foot" (size of the base). Flexibility decreases when welded area dimensions increase
- position of the welded profile on the belt. When the cleats are welded in axis with the teeth, belt flexibility is better than when cleats are welded in axis with the little nose.

Please find, in the following table, flexibility properties for the cleated belts.

MINIMUM NUMBER OF PULLEY TEETH							MINIMUM NUMBER OF PULLEY TEETH

STANDARD PARALLELEPIPED PROFILES WITH HOLES

Parallelepiped profiles are available also with holes, to satisfy special applications; please find below the standard tolerances for this kind of cleats.

For belt flexibility and mechanical resistance, please kindly refer to values for cleats without holes.

MOULDED CLEATS

Using an high performance injection system, Megadyne can produce any profile designed by the customer. For cleats not yet present in following pages, Megadyne can produce dedicated mould according customer requirements. For belt flexibility and mechanical resistance, please kindly refer to standard parallelepiped profiles section.

CLEATS

SPECIAL CLEATS DRAWING LIST

If the needed cleat wouldn't yet present in the following tables, please contact MEGADYNE staff.

COVER PROPERTIES

Megalinear belt can be coated with several materials. Those coatings are able to suit Megalinear belts to all applications. Main advantages for using coated belts are: reducing noise and modifying friction in conveying materials. Choice of correct coating depends on application field.

Megadyne is able to supply extruded coated belt, in this case coating method is same as belt production method and cohesion between belt and cover is guaranteed by welding without using glue.

Properties of extruded coating are followings:

	Cover type								
	NFB nylon fabric back	NFT nylon fabric teeth	AVAFC 60	AVAFC 70	AVAFC 85	Foamed polyurethane	APL	Fishbone	Ribbed
Raw material	nylon	nylon	polyurethane	polyurethane	polyurethane	foamed polyurethane	polyurethane/PVC	polyurethane	polyurethane
Hardness (ShA)	-	-	60	70	85	50	55	70	70
Colour	green	green	transparent	transparent	transparent	yellow/grey	red	transparent	transparent
Coating and belt cohesion method	by extrusion	by extrusion	by extrusion	by extrusion	by extrusion	by spray	by extrusion	by extrusion	by extrusion
Thickness range (mm)	-	-	2/3/4	2/3/4	2/3/4	0,5 till 8	3,5	4,3	2,7
Tolerance on coating thickness	-	-	+/- 0,3	+/- 0,3	+/- 0,3	+/- 0,3	+/- 0,3	+/- 0,5	+/- 0,5
Working temperature range (°C)	-20 +80	-20 +80	-20 +80	-20 +80	-20 +80	-20 +60	-20 +60	-20 +80	-20 +80
Friction coefficient (1)	0,25	0,25	0,65	0,65	0,6	0,4	0,7	0,6	0,6

SPECIAL EXECUTION FEASIBILITY

Megadyne can make special extrusion on customer request to improve belt properties and to suit better to special applications.

SPECIAL POLYURETHANE

On customer request and with minimum quantity, Megalinear belt can be produced with different hardness:

- 85 ShA food quality polyurethane for contact with food and medical products
- 92 ShA higher resistance to temperature
- 92 ShA silicon free for painting system based on water
- 95 ShA glass reinforced
- 98 ShA extra hard polyurethane

COLOUR

On customer request and with a minimum quantity is possible to produce megalinear with several colours. Different colour doesn't influence belt technical properties so mechanical features are same as standard white belt. Available colours are: • White • Black • Blue • Yellow • Transparent

SPECIAL EXTRUSION

On customer request, Megadyne R&D department can develop special extruded belts by designing special mould. It is also possible to extrude standard belt with special cords position, ready for successive reworkings.

MECHANICAL REWORK

Megadyne have been producing specialized belting for many years. Our in-house facilities enable us to produce belt with special holes for vacuum conveyors, belts with special backings / ground finishes for high tolerance applications. We can remove individual teeth and perforate the timing belt as required.

BACK GRINDING

A belt back can be ground to achieve a precise belt thickness as an adjunct to precision drives. When belt back grinding to a tolerance is required, the total thickness, including the tooth, must be specified. A grinding tolerance of +/- 0.2 mm is achievable with a level finish (i.e. thickness will not vary greatly around the belt). Most widths and lengths are available.

LONGITUDINAL REWORK

Longitudinal rework along the belt back is possible on covered and uncovered belts. The profile can be machined precisely for required function. The measurement is given as the depth on the belt back. Most widths and lengths are available.

REWORK ON BELT TEETH

The rework of the tooth profile can be very useful, i.e. improving the steering effect with guide rails. The rework dimension is given from the top of the tooth. Most belt widths and lengths are available.

HOLES IN TIMING BELTS

Holes in timing belts can be for vacuum or air film conveying or as clearance for assembly mechanisms. Stops and cams can be attached through the holes. Customized tooling may be required depending on the layout and dimensions of holes required.

SINGLE TOOTH REMOVAL

Single and multiple tooth removal is available to your requirement, for applications in handling and conveying technology.

Megadyne now offers antistatic belts. Under certain conditions, a polyurethane belt may build-up a significant static electric charge. For applications where belts are intended for operation in a potentially explosive atmosphere or near electrical components, polyurethane belts should be sufficiently conductive to dissipate this electrical charge. Belts can be constructed (using proper nylon fabric coating) with a relatively low electrical resistance characteristic and are typically referred to as "static conductive" surface or "antistatic" surface. The test methods for determining the surface resistive properties of a belt are based on ISO 9563, "Belt Drives - Electrical Conductivity of Antistatic Endless Synchronous Belts - Characteristics and Test Method". The electrical resistance, in ohms, can be found using the test methods in ISO 9563 and the following equation:

$$\text{Resistance} = \frac{(6 \cdot 10^5) \cdot L}{W}$$

where: L = is dry distance between electrodes (minimum suggested: 7 teeth)
 W = is the width of the belt (inches)
 Test Voltage = 100 V

Based on this calculation and experimental results, belts can be categorized according to the following table:

	Antistatic (Conductor)	Electric Dissipative	Resistive (Insulator)
Belt Resistivity Range (Ω)	$< 6 \cdot 10^5$	$6 \cdot 10^5 < < 1 \cdot 10^5$	$> 1 \cdot 10^5$

TYPICAL APPLICATIONS

- Conveyance of PC boards or other electronic assemblies
- Semiconductor processing
- Conveying munitions of explosive detonators
- Paper conveying
- Power transmission applications in textile industries
- Chemical environment power transmission or conveying
- Clean room conveyors and power transmissions

SPECIAL EXECUTION PHOTOS

Glass industry

Coating and special grinding on the back allow Megadyne belt to be suitable to all customer applications

Tobacco industry

Belt with special cleats for tobacco industry

Nappy industry

Wide extruded belt for nappy industry

Packaging industry

Special reworking to install custom made elements

Automotive industry

Belt suitable to convey steel coils and plates due to guides on the back

Paper industry

Special extruded belt for vacuum conveyor application in paper industry

Carton industry

New extruded belt
for vacuum application
in carton conveyor industry

**Conveyor application**

Special coating for conveyor application

**Automotive industry**

Due to its antistatic properties,
belt suitable for steel plate conveyor
in car industry

**Lift industry**

Patented belt
designed on customer requirement
for an innovative lift system

**Fish industry**

High variety of cleats allow
Megalinear belts to work
in several fields
